August 22, 2006, University of Maryland Inn and Conference Center

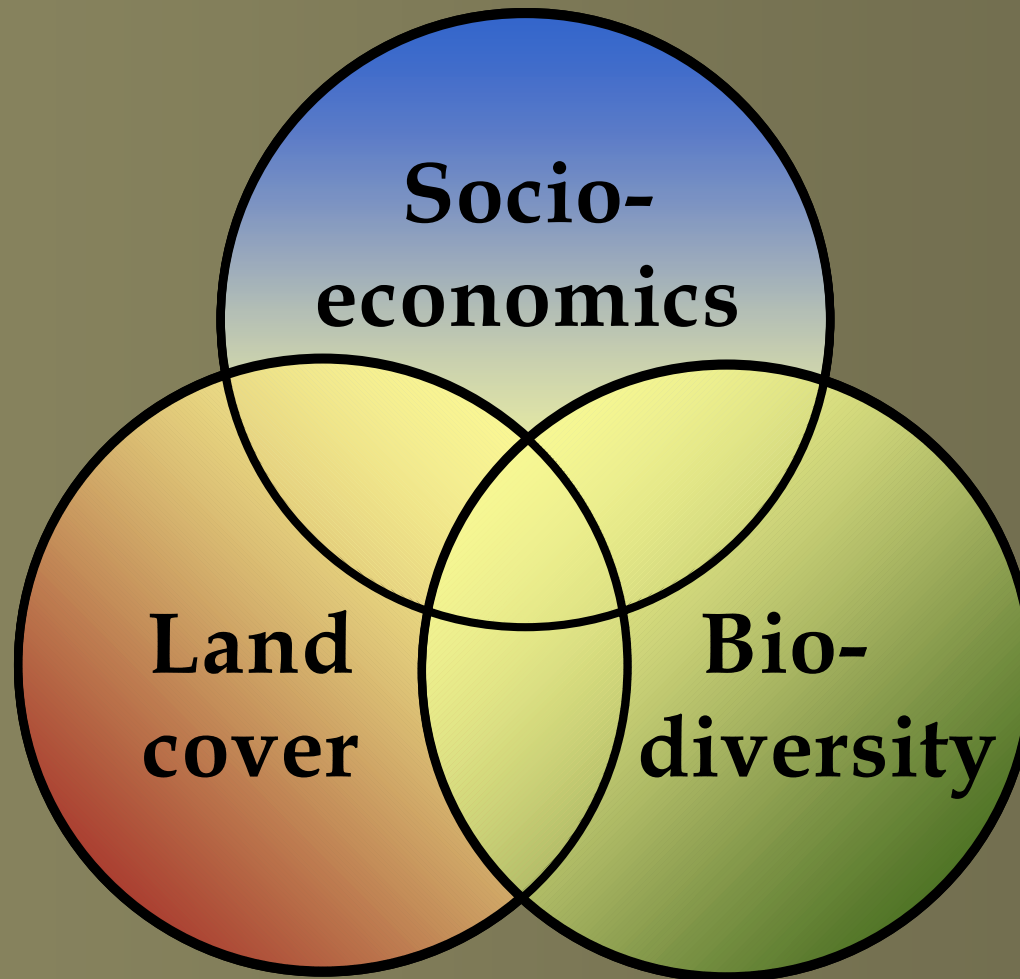

Introduction

- ✦ In 1990, the Soviet Union broke down, and with it's control on eastern Europe
- ✦ Socialistic state-economies shifted towards capitalistic free-markets
- ✦ Question: how did this socioeconomic change affect land use and land cover, and thereby biodiversity

Study area (MODIS land cover)

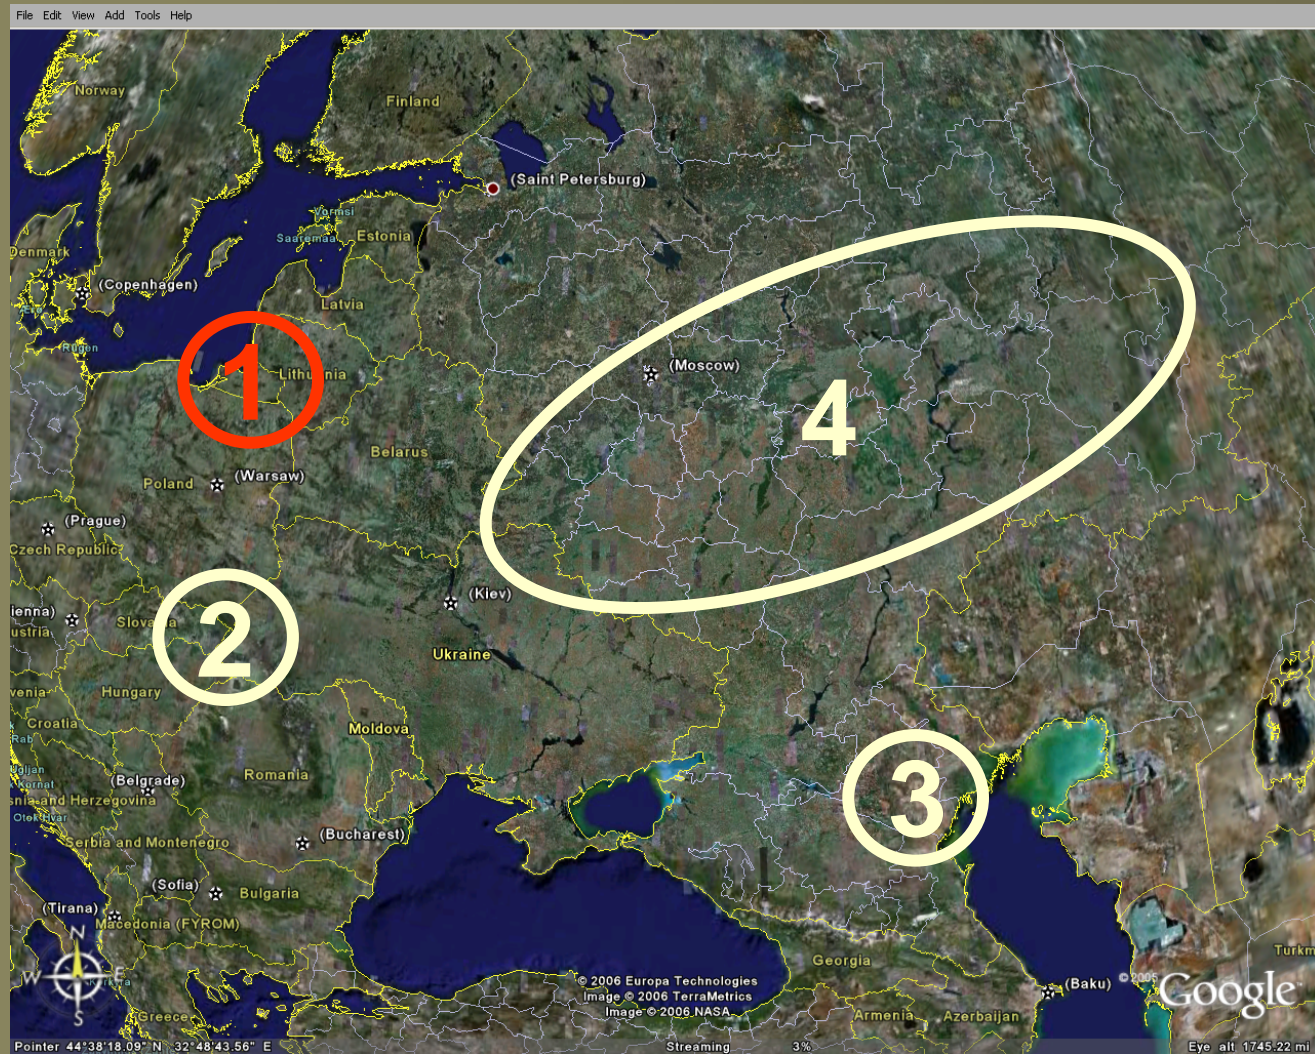

Introduction

Outline

1. Kaliningrad

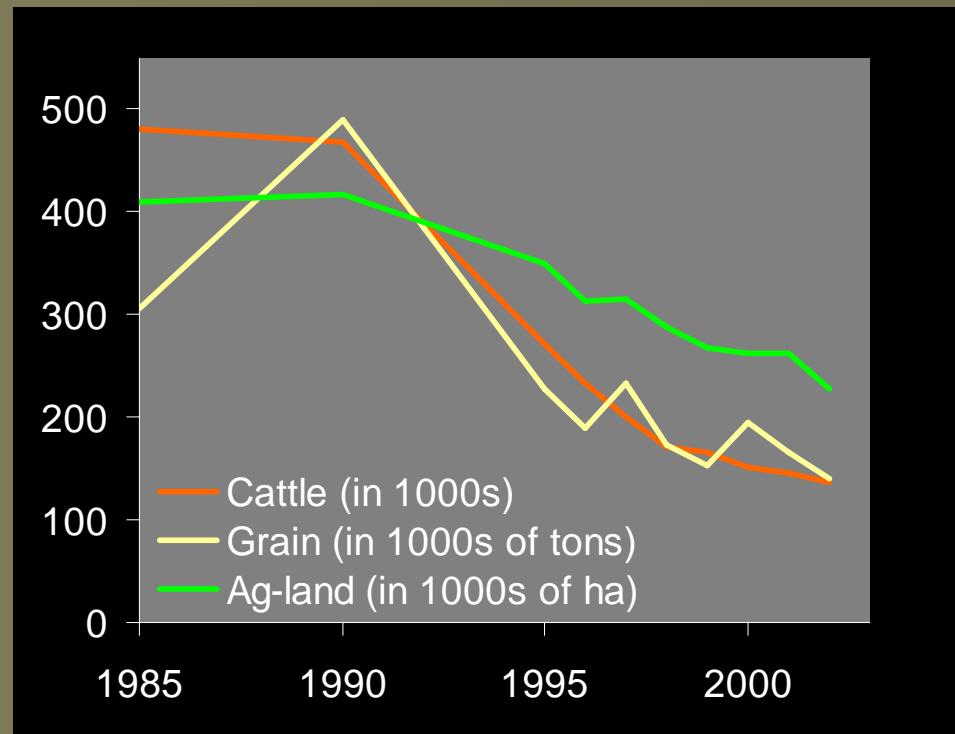

1. Kaliningrad

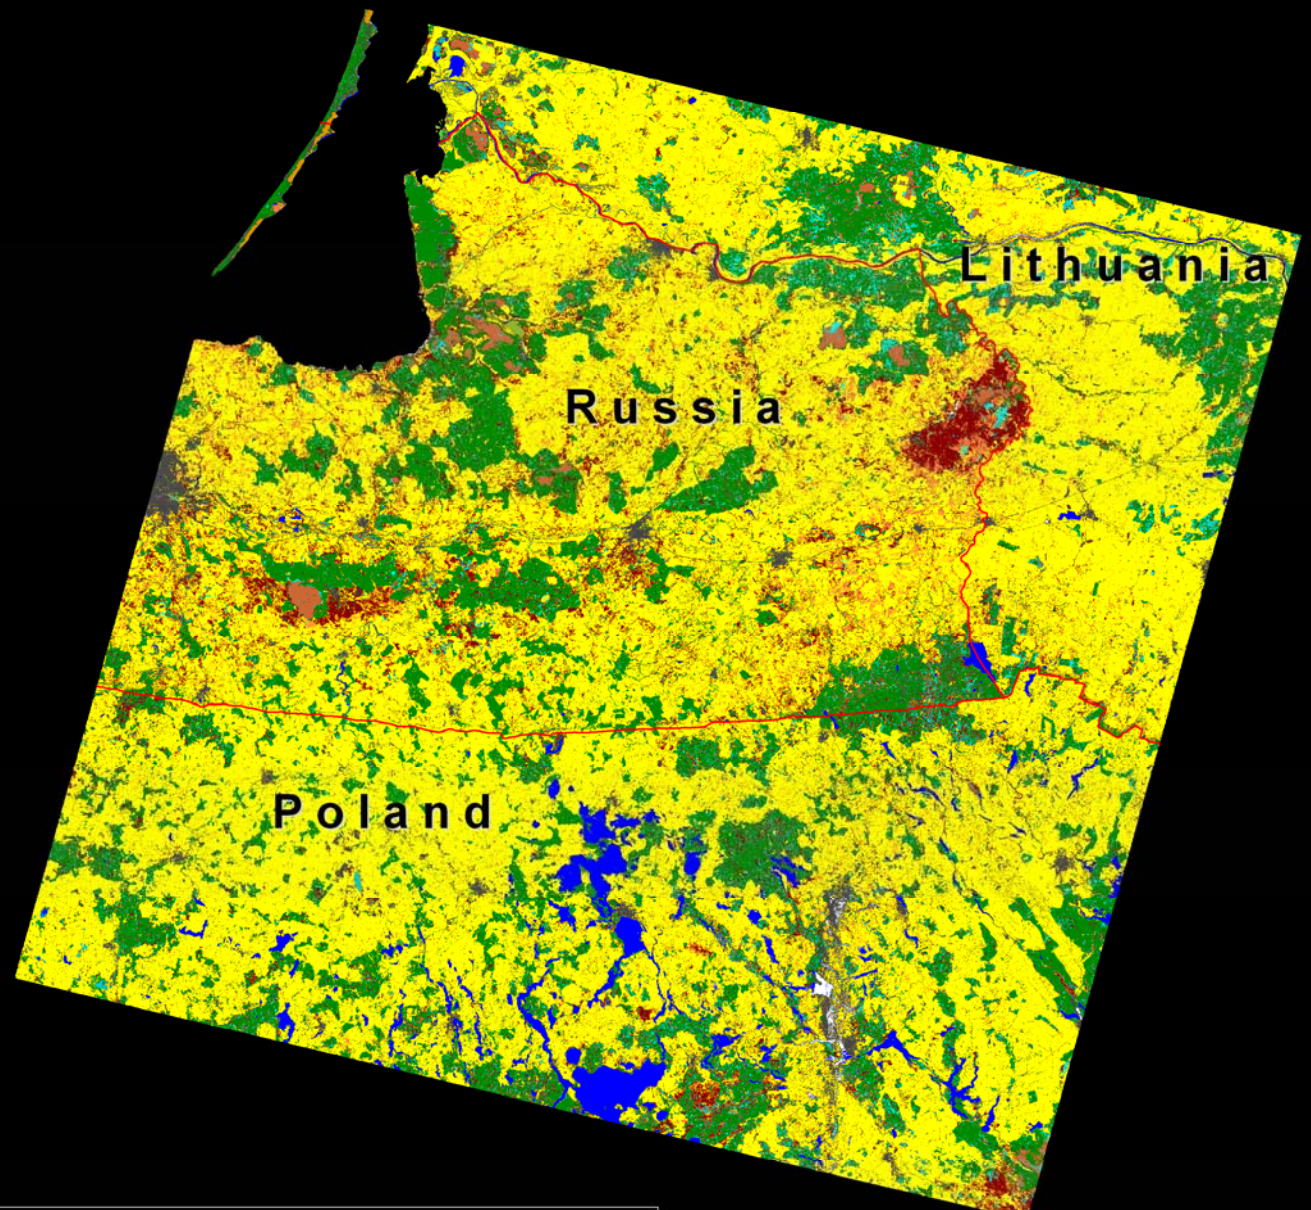

✦ Agricultural statistics show strong declines in row crops and livestock since 1990

✦ Landsat TM/ETM+ change detection 1988 – 2000

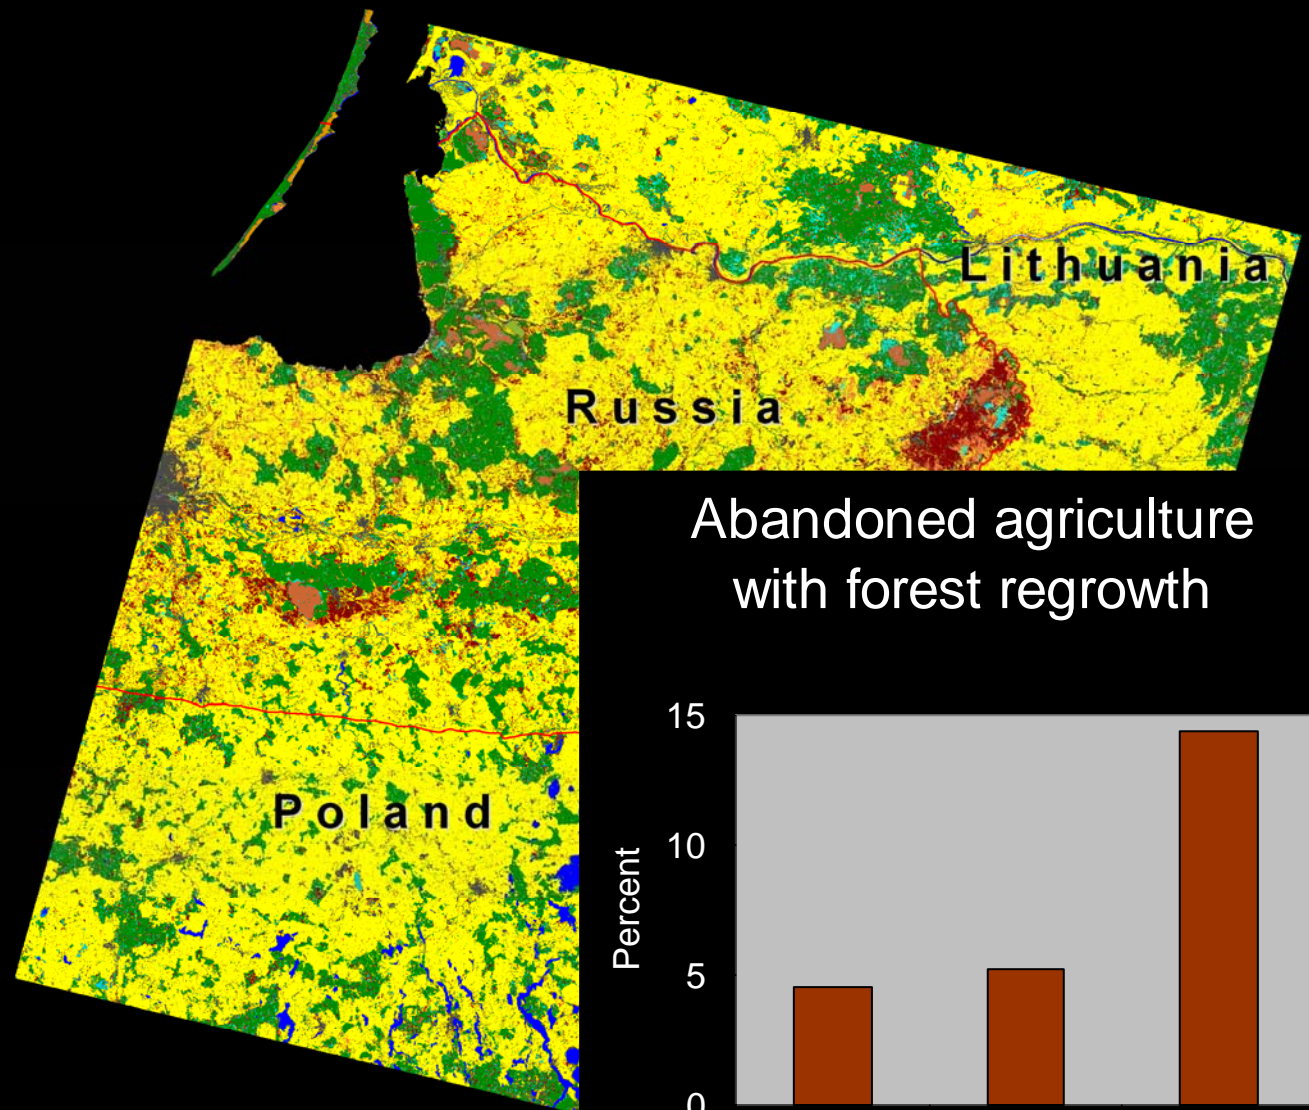

✦ Comparison with Poland and Lithuania

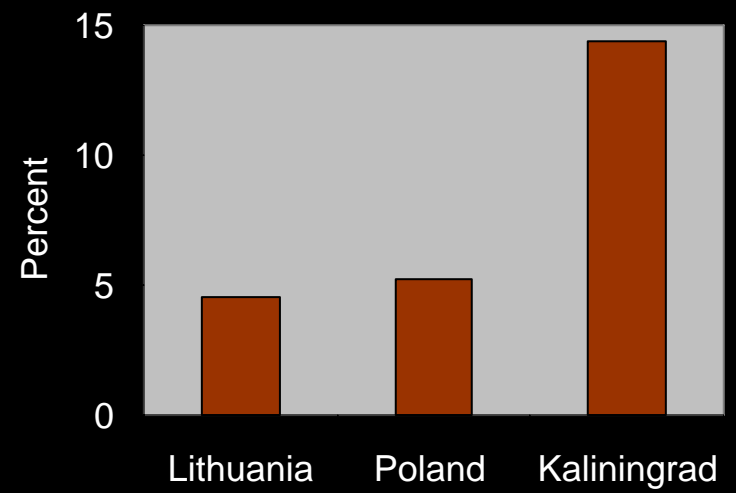

-  Agriculture
-  Forest
-  Harvested forest
-  Re-growth
-  Settlements
-  Water
-  Grassland
-  Clouds
-  Sand dunes
-  Wetlands

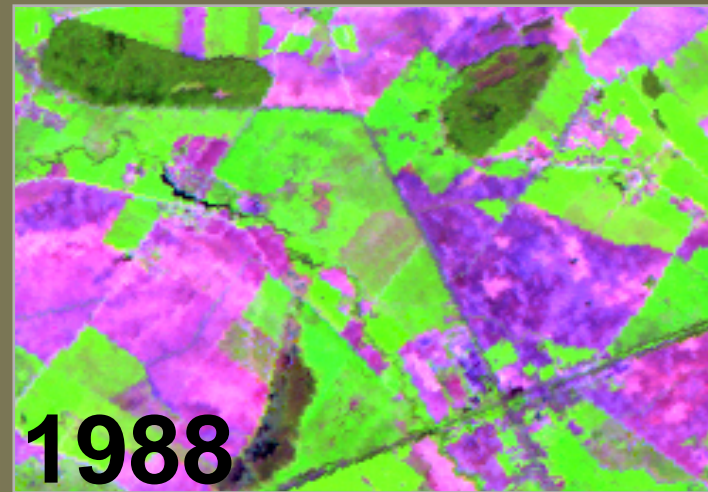

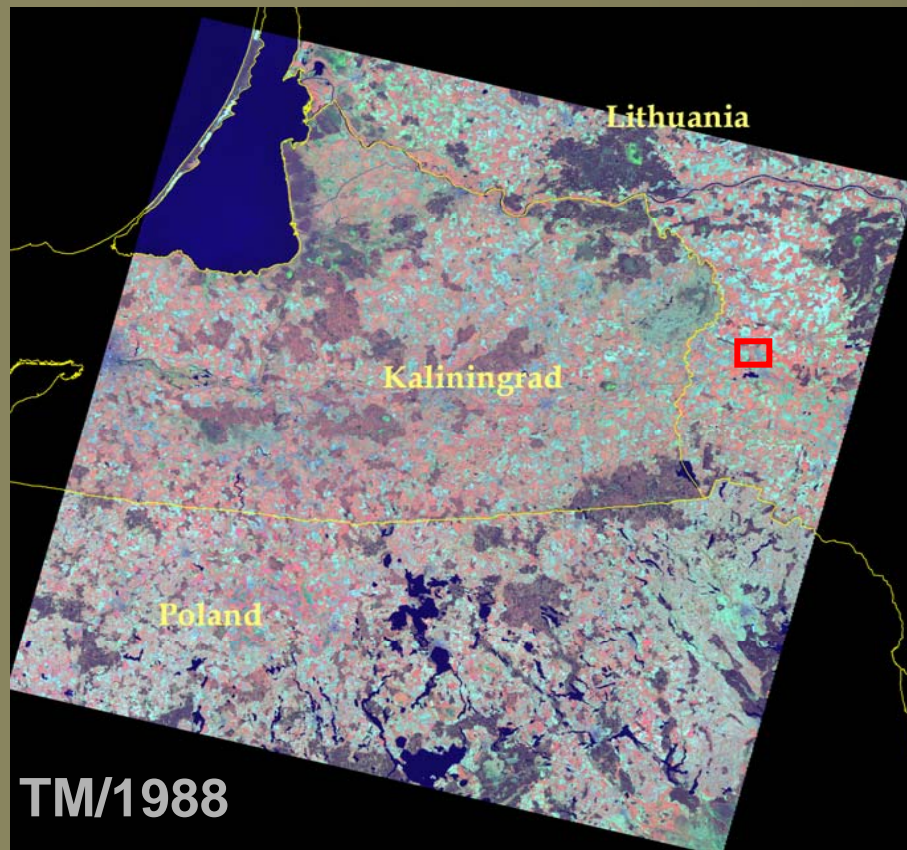

- Agriculture
- Forest
- Harvested forest
- Re-growth
- Settlements
- Water
- Grassland
- Clouds
- Sand dunes
- Wetlands

Abandoned agriculture
with forest regrowth

1. Kaliningrad

1. Kaliningrad

- ✦ Agricultural abandonment widespread
 - ✦ Forests are regrowing
 - ✦ Change in agricultural rotations
 - ✦ Farm fields are fragmenting under private ownership
- ✦ These trends are typical for the North of Eastern Europe
- ✦ Land cover change trends differ strongly among countries

2. Carpathians

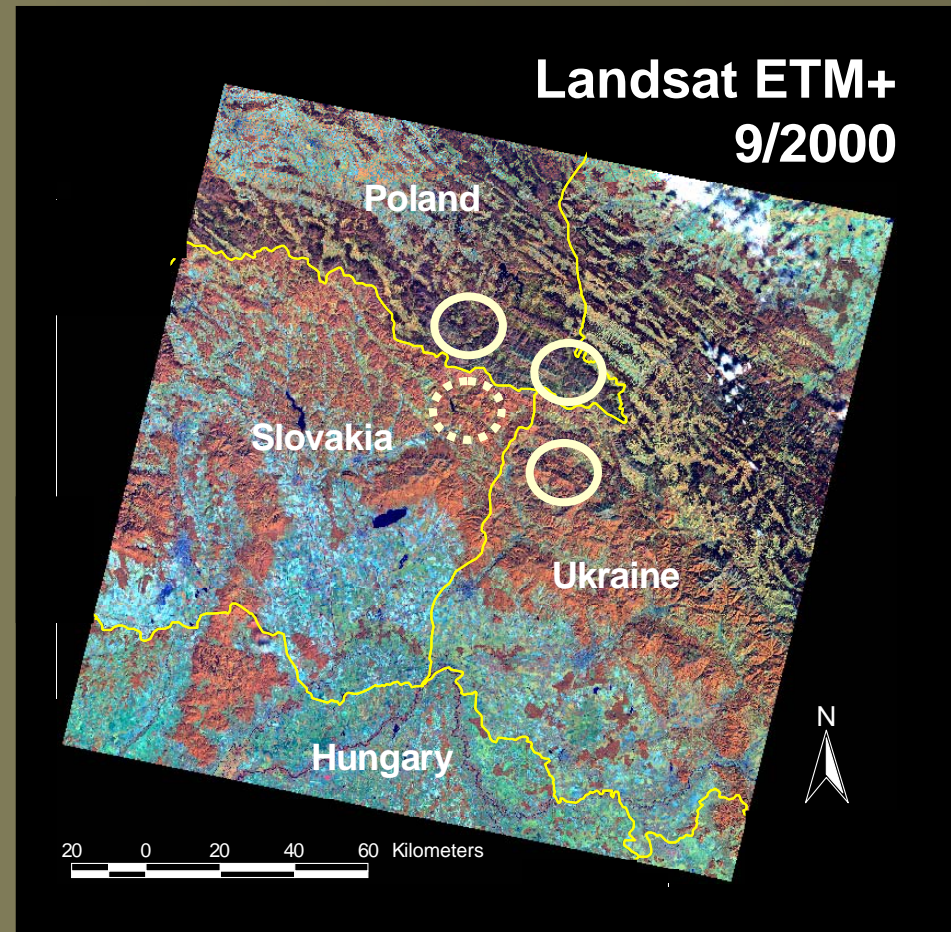

2. Carpathians

✦ Wild bison herds

Radiocollared bison in the Slovak Carpathians, Dec. 2004

2. Carphathians

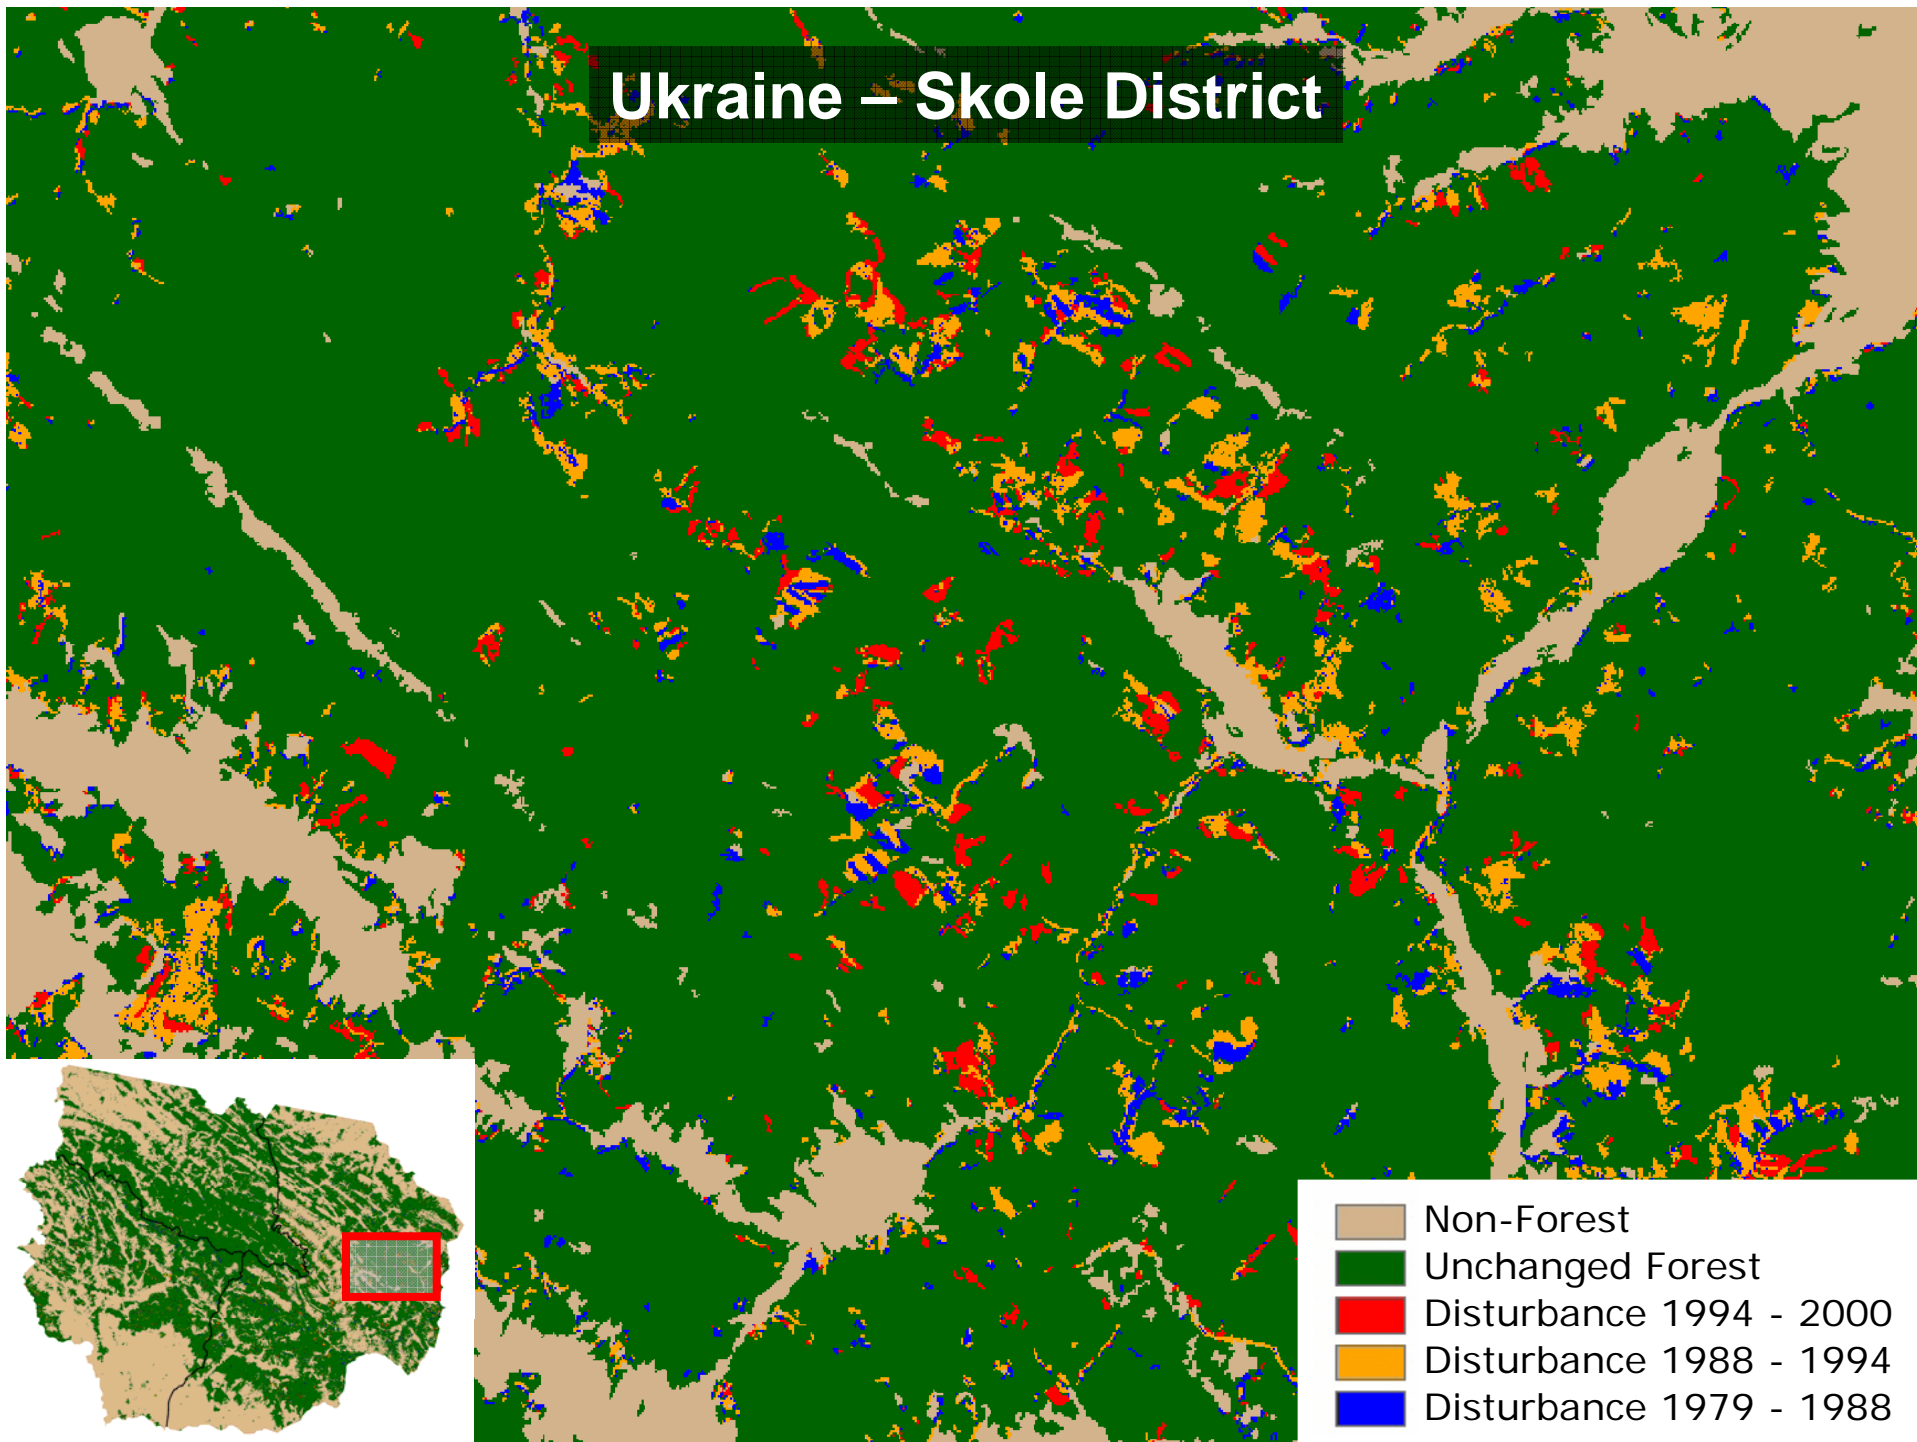

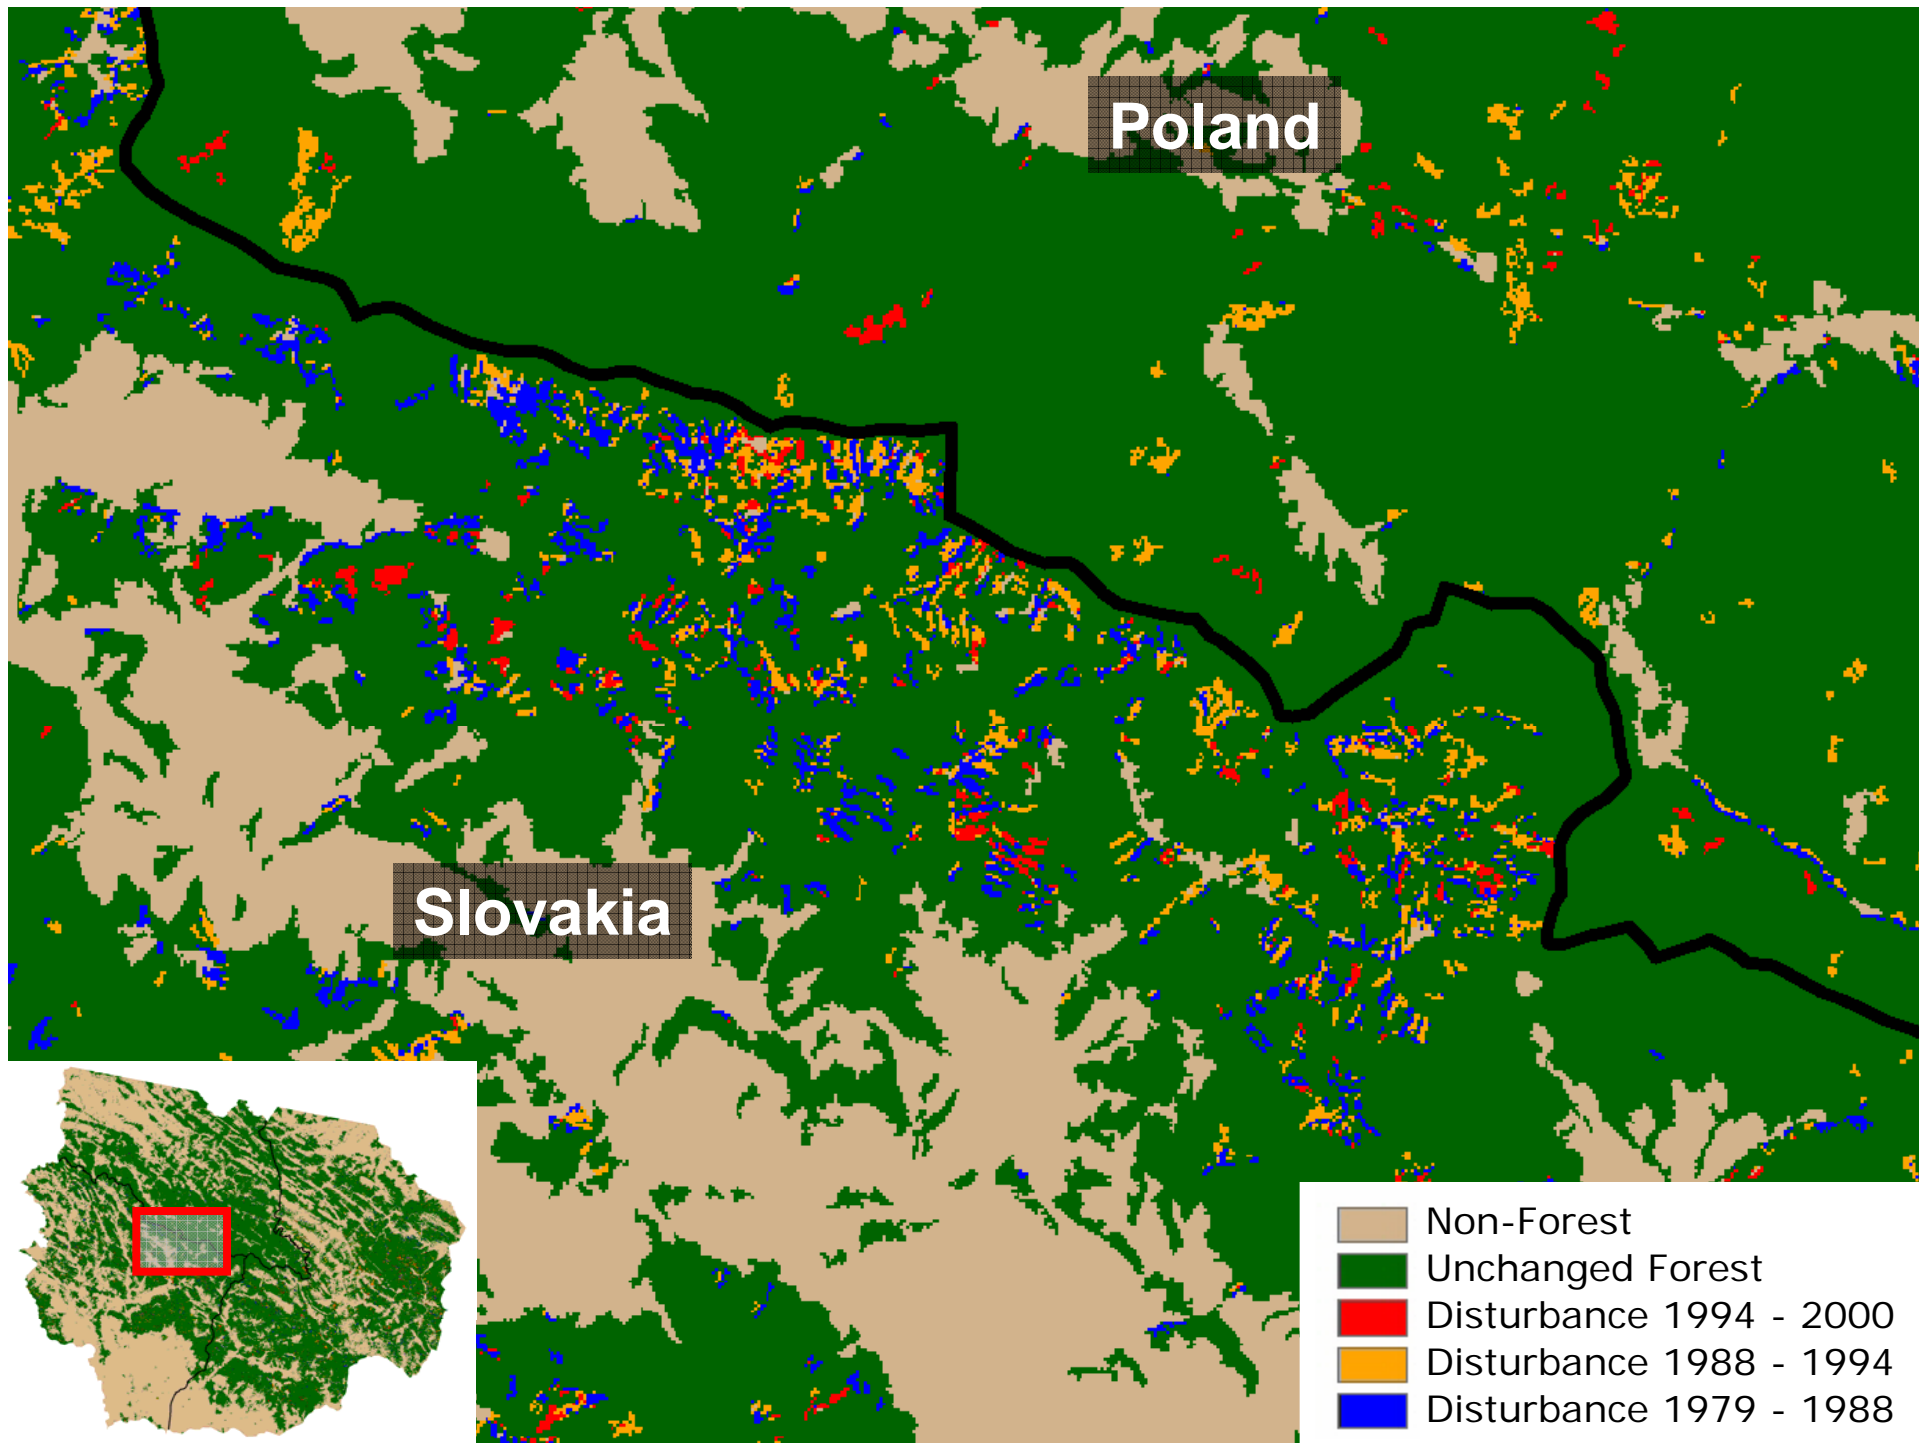

2. Carpathians

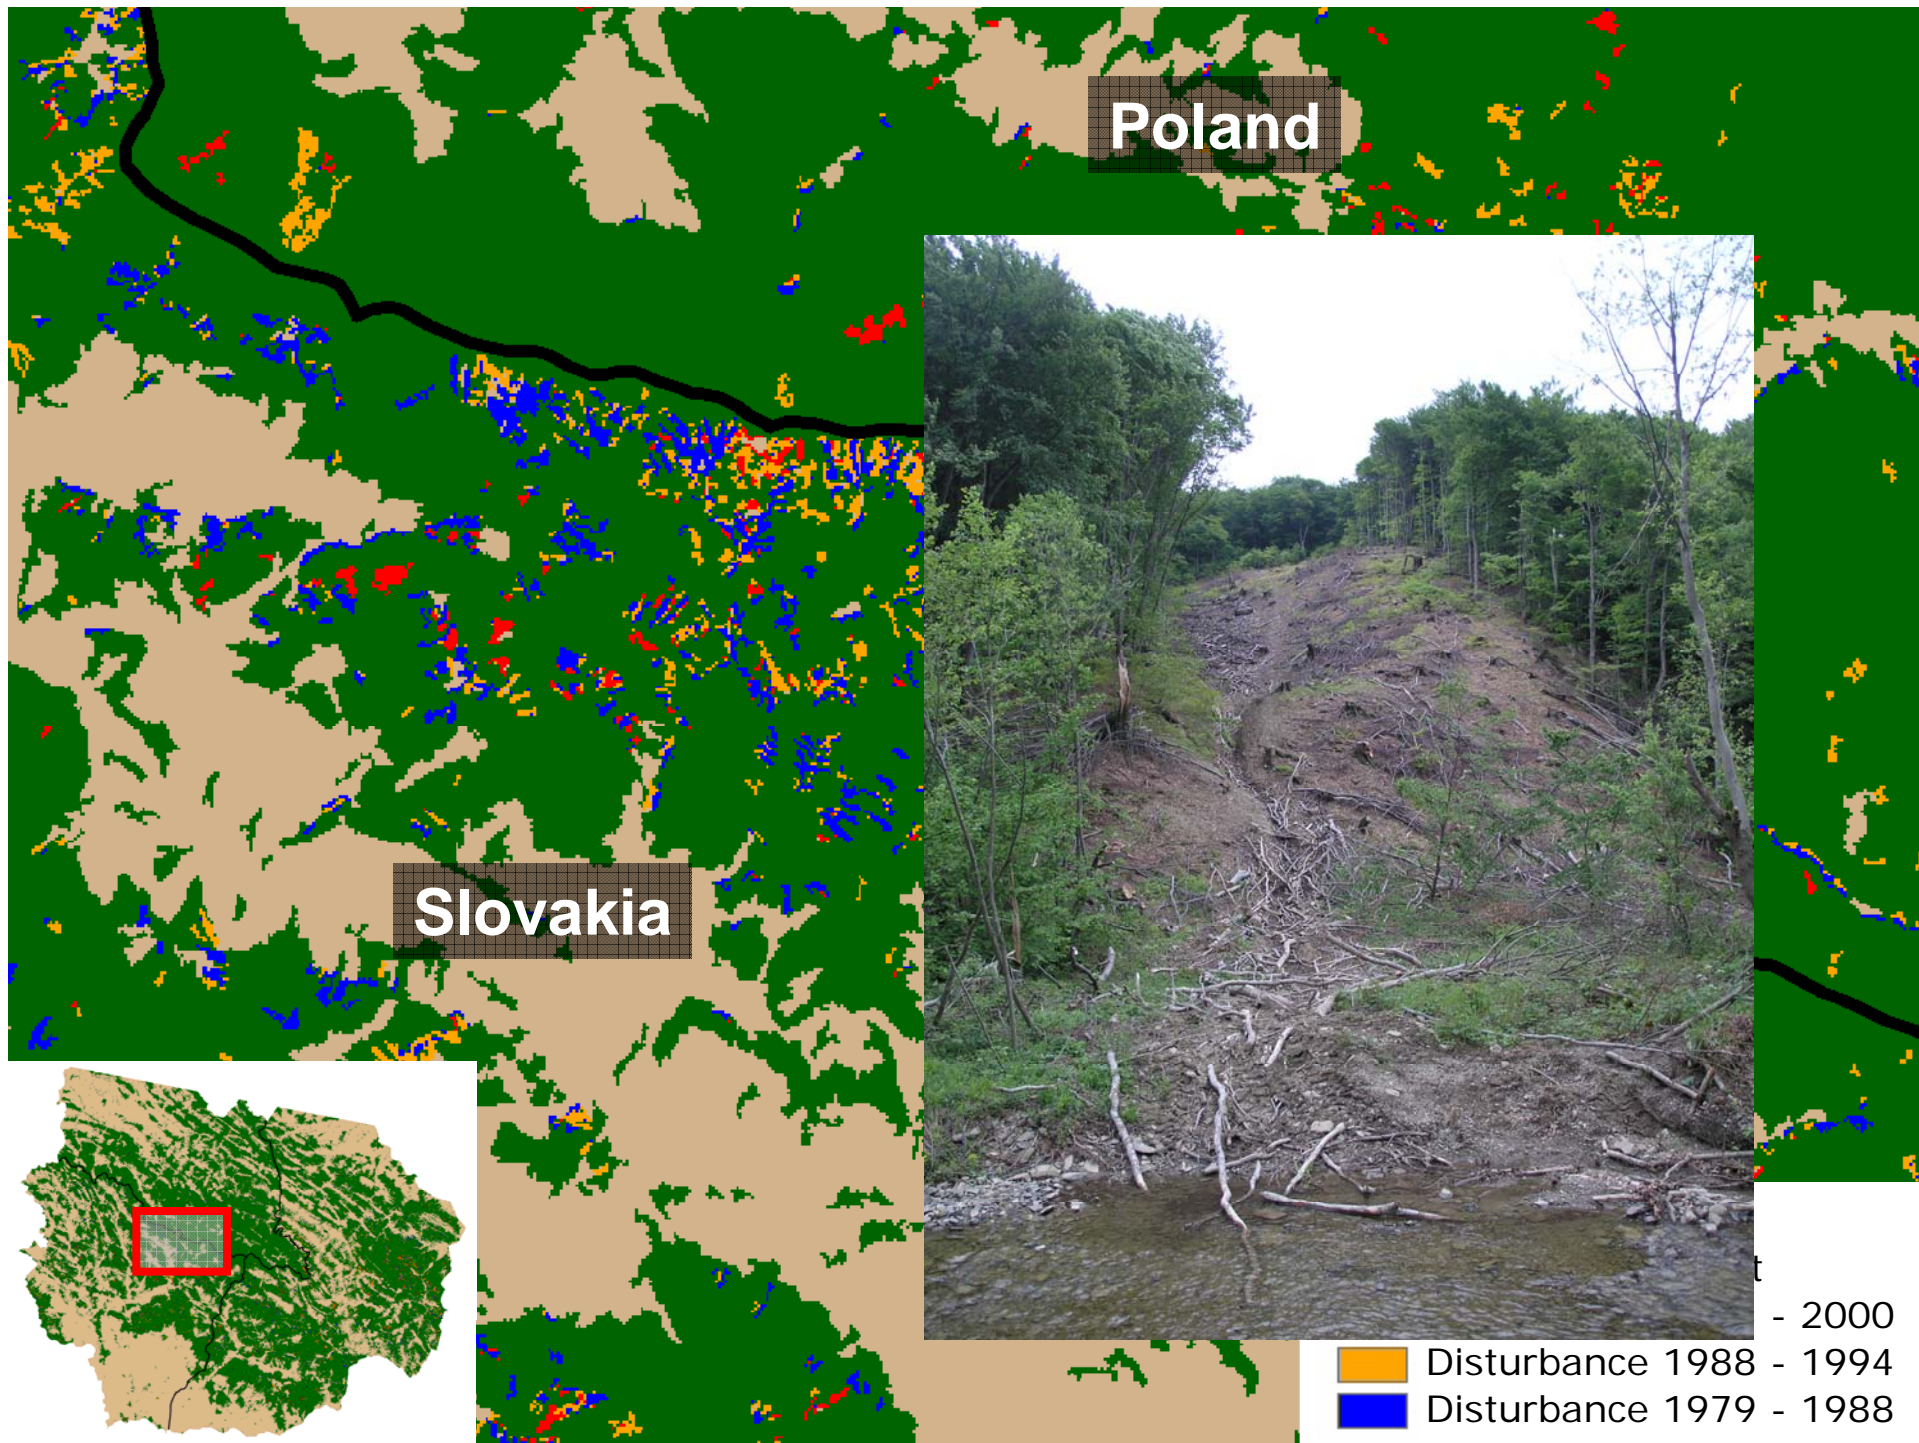

- ✦ Reports of widespread timber poaching
- ✦ Landsat MSS/TM/ETM+ change analysis
 - ✦ 1988 TM basemap forest/non-forest
 - ✦ Check if '88 non-forest was forested in '77 MSS
 - ✦ TC-disturbance index for '88, '94, '00 TM/ETM+
 - ✦ Classification

Ukraine – Skole District

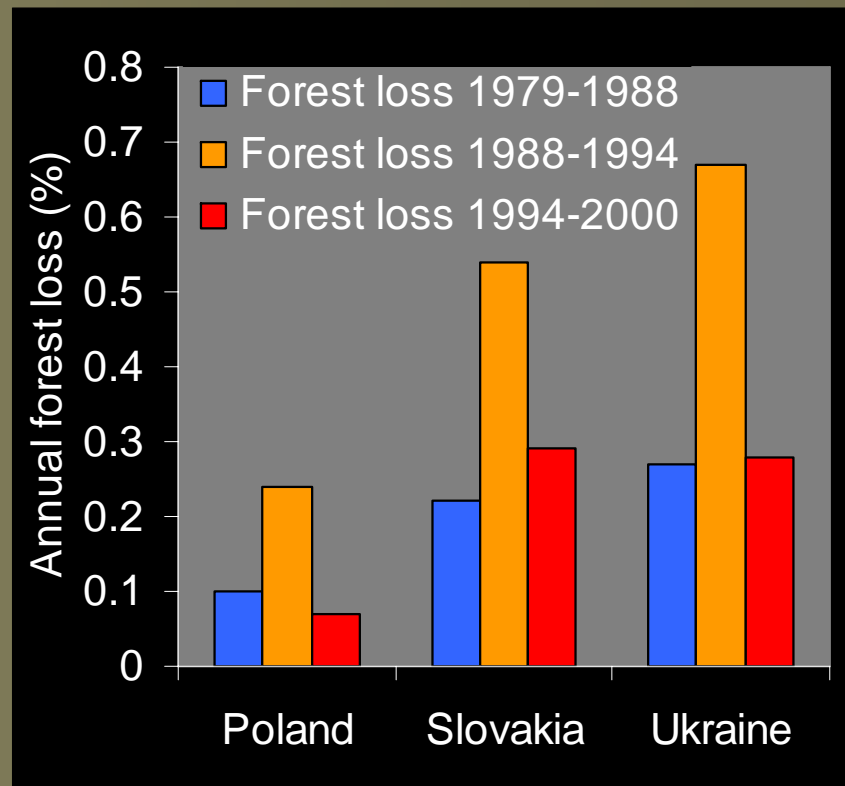

2. Carphathians

- ✦ Disturbance peaked around 1990, right after the transition from socialism to capitalism
- ✦ Strong differences among countries
- ✦ Annual forest loss rates in the Ukraine are up to 3 times higher

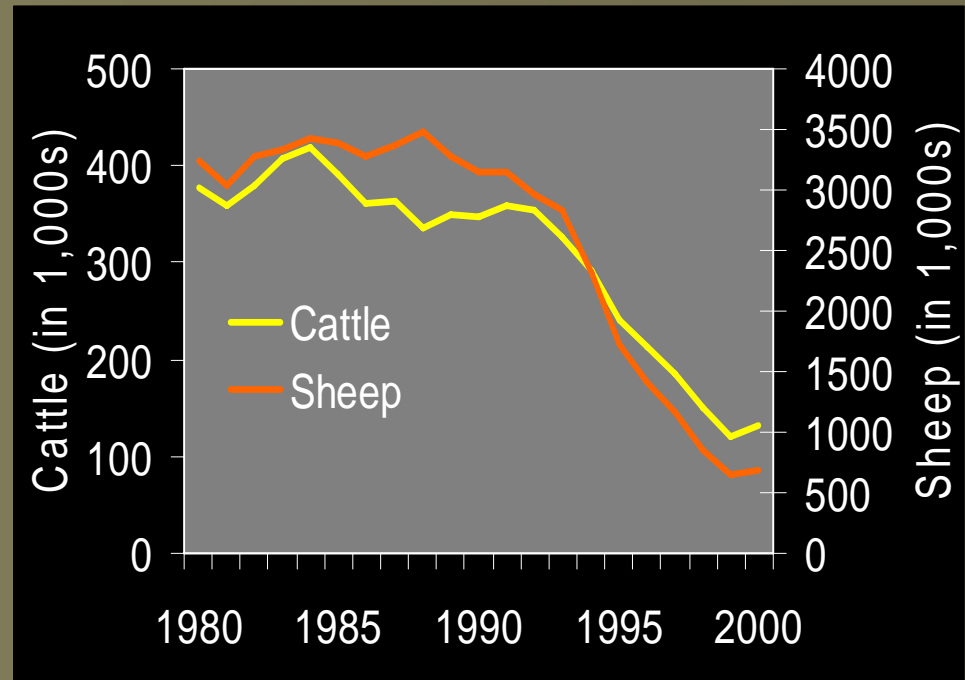

3. Kalmykia

3. Kalmykia

- ✦ Kalmykia is very dry, and dominated by short-grass steppe
- ✦ Row-crops were never common
- ✦ Livestock grazing was the main land-use

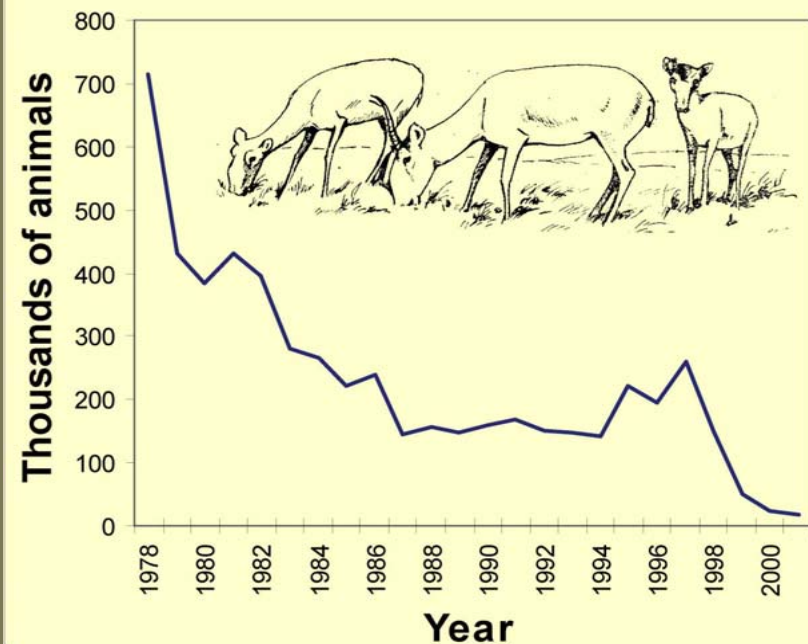

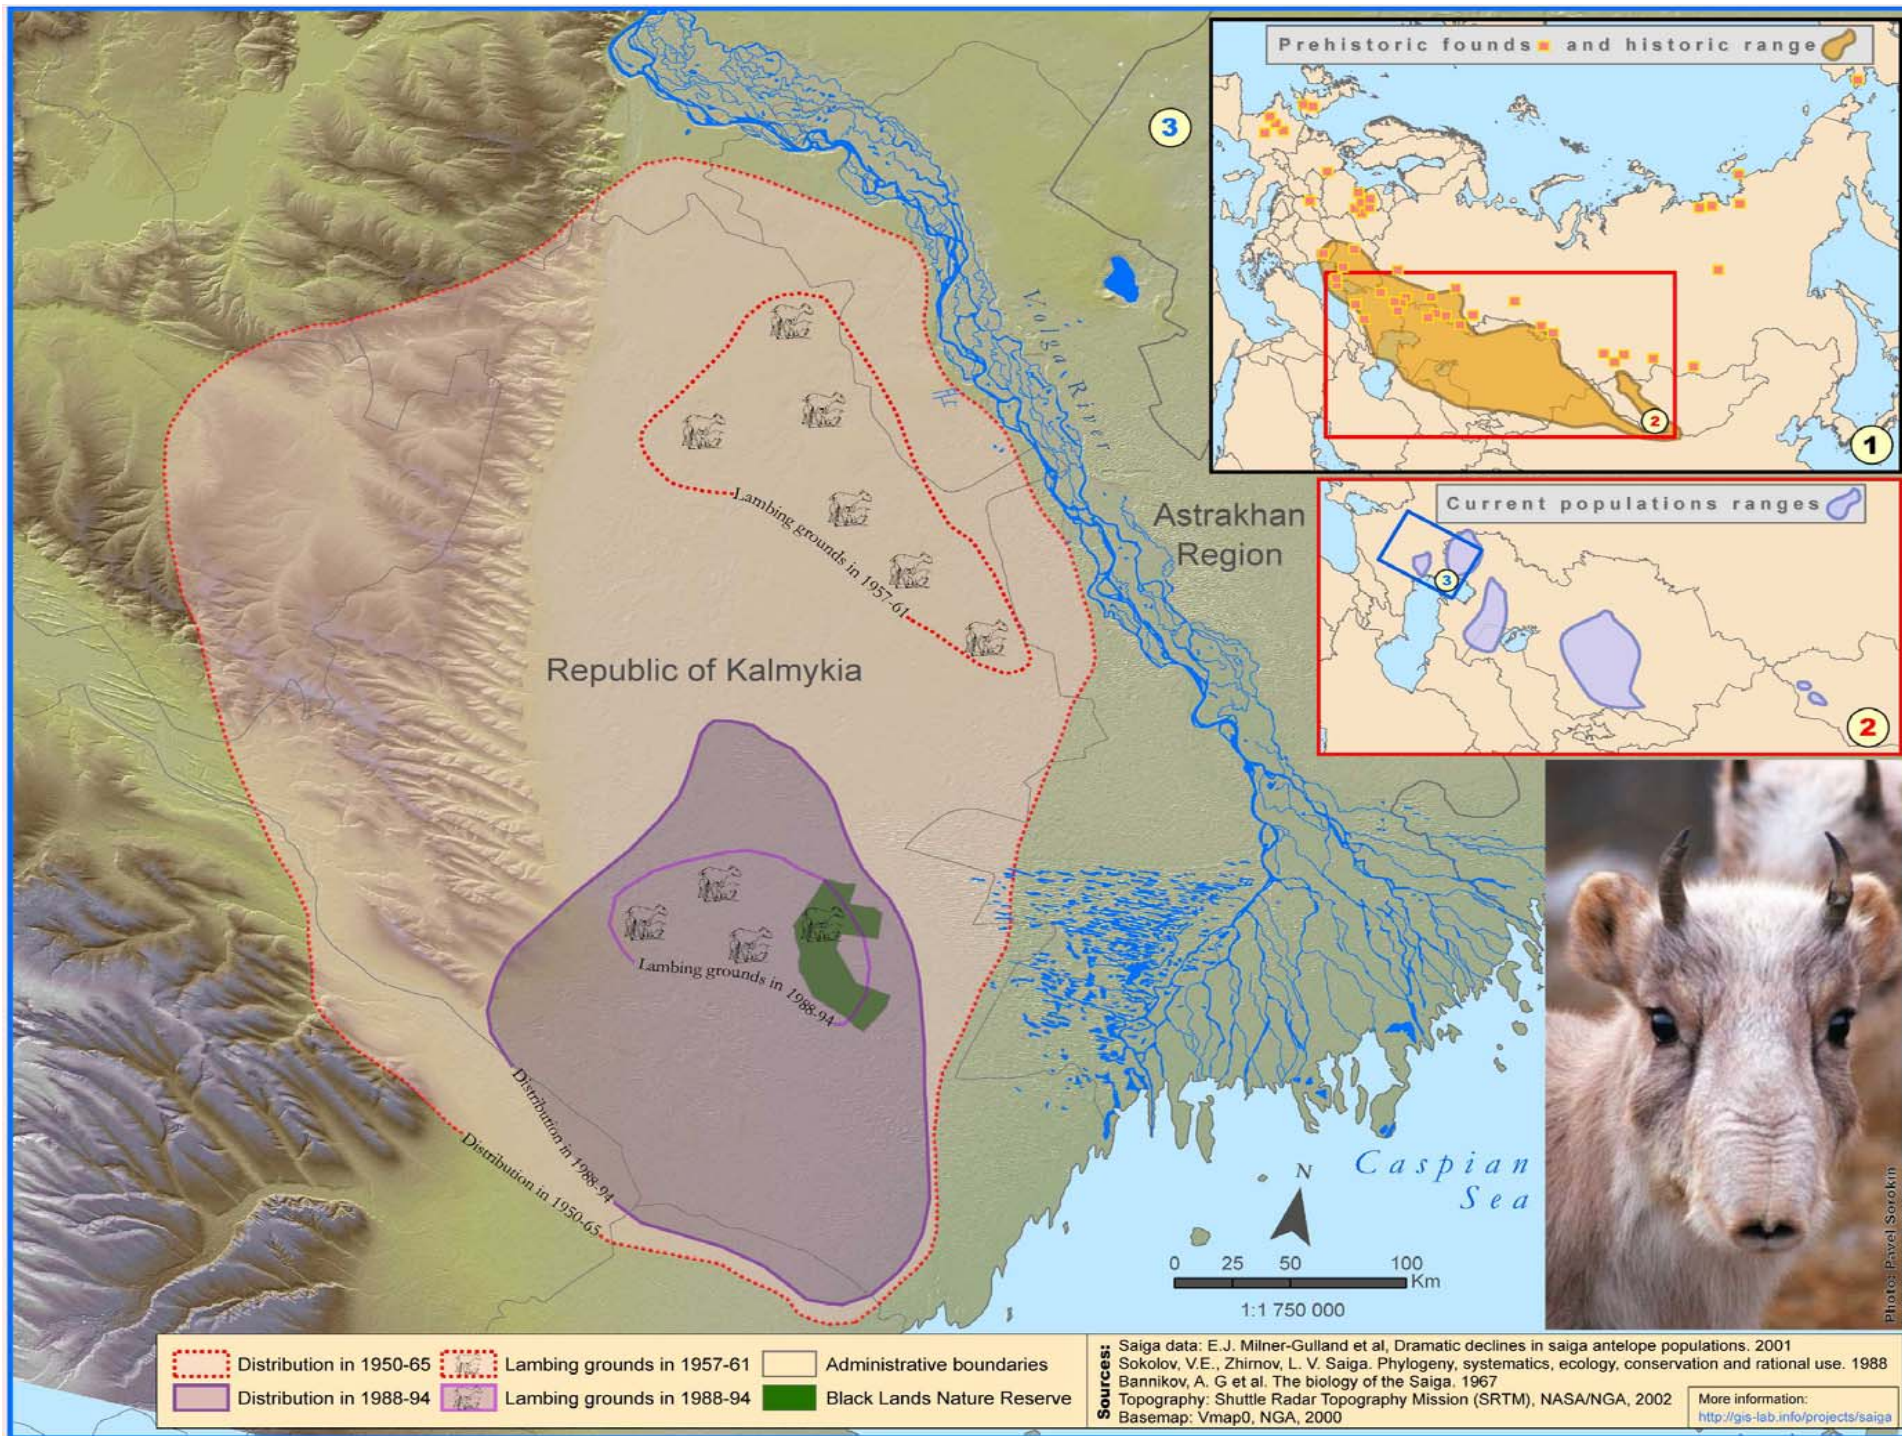

3. Kalmykia

✦ Saiga populations have plummeted after 1990, largely due to poaching

Population dynamics in 1976-2001

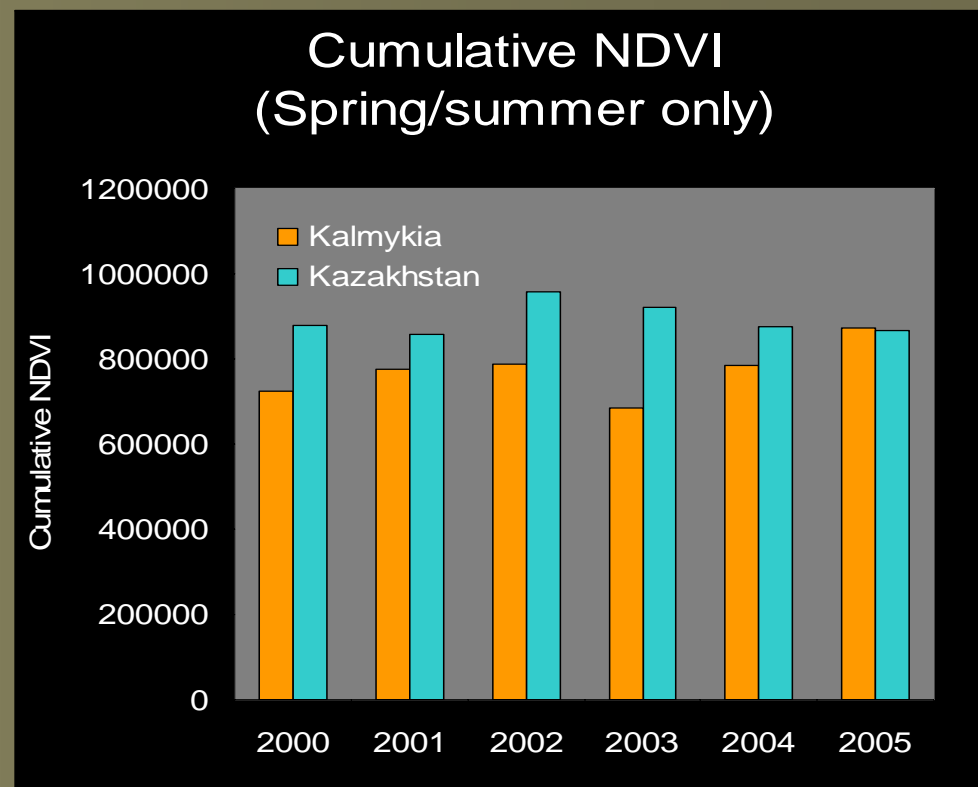

3. Kalmykia

- ✦ Saiga in Kalmykia no longer migrate, and they no longer use their traditional calving grounds
- ✦ How does range contraction affect saiga?

	Kalmykia	Kazakhstan
Male	25-43kg	37-49kg
Female	15-28kg	22-37kg

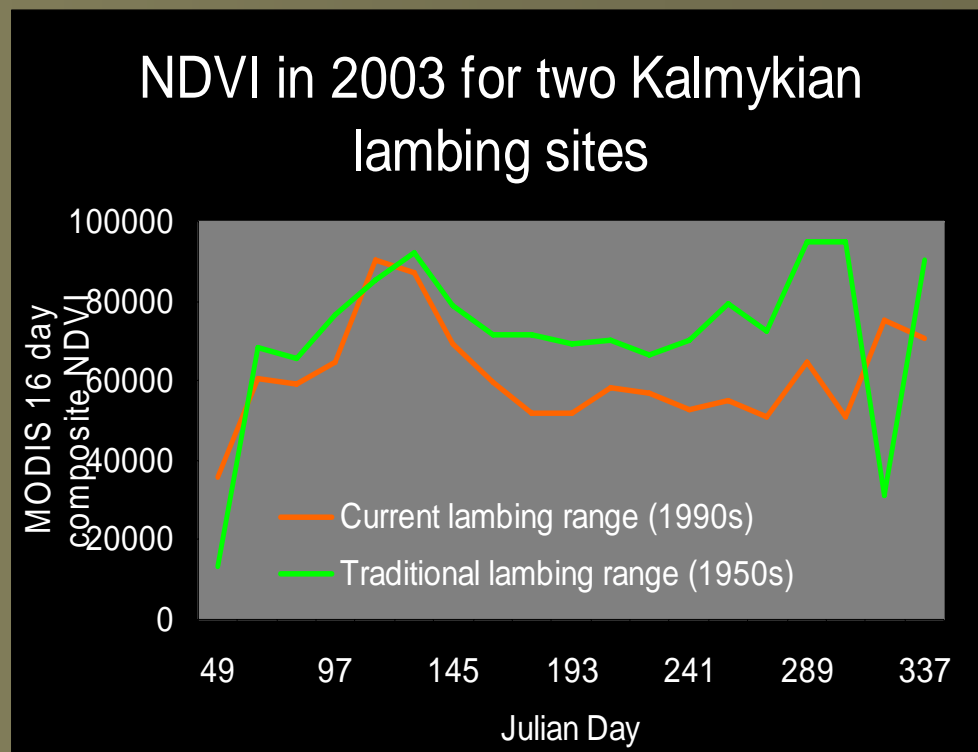

3. Kalmykia

✦ Kalmykian summer grounds have lower NDVI during the growing season than those in Kazakhstan

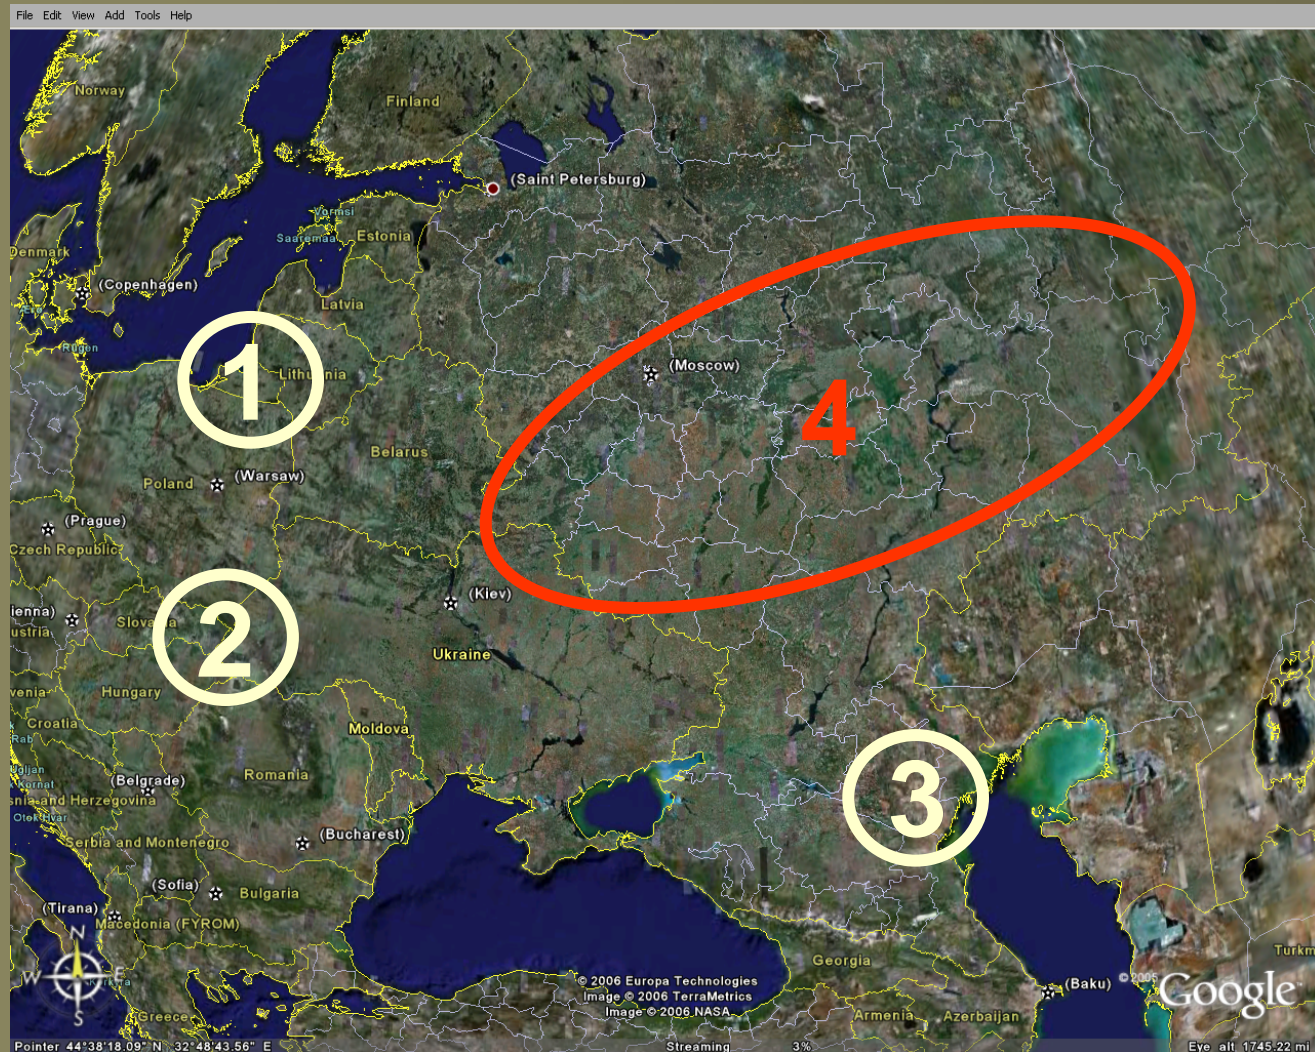

3. Kalmykia

- ✧ Within Kalmykia, saiga are pushed into sub-optimal habitat
- ✧ NDVI is higher in the traditional calving grounds
- ✧ Realized niche versus ecological niche

4. Bears in European Russia

4. Bears in European Russia

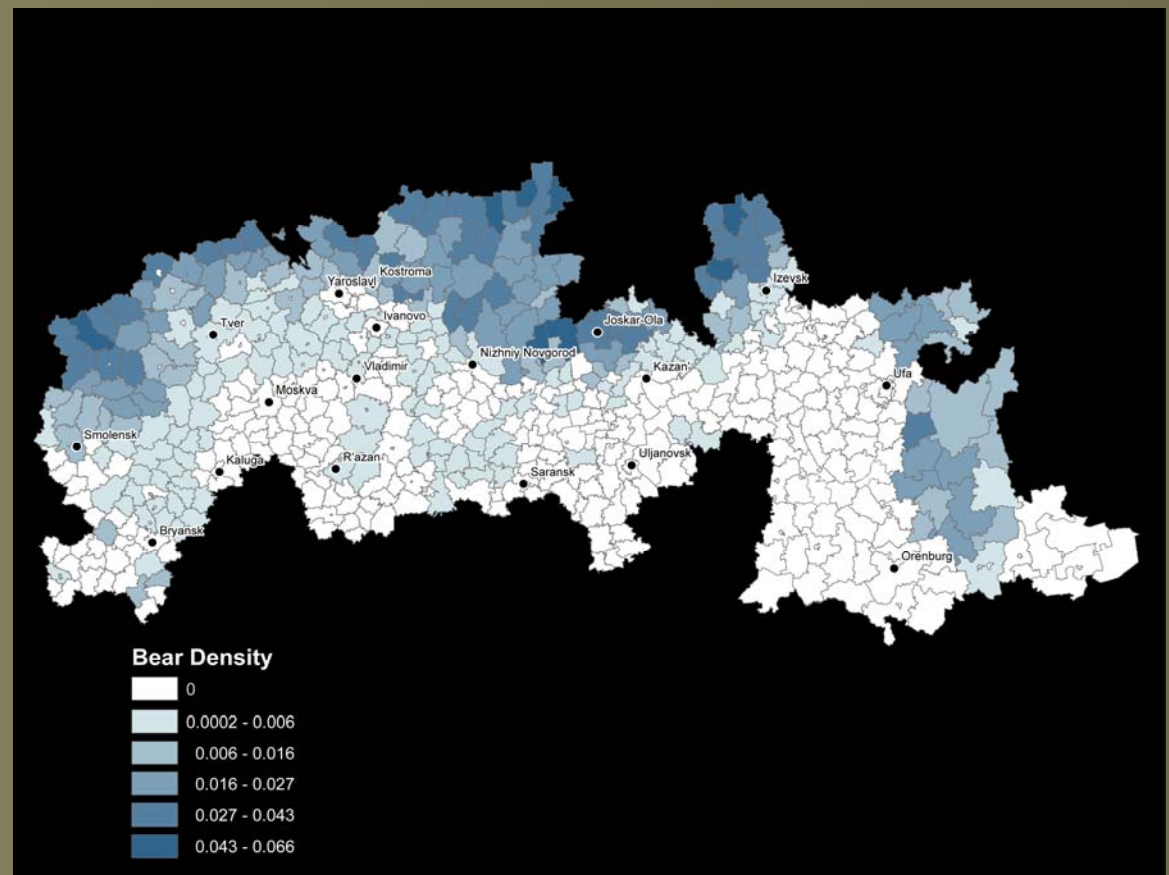

4. Bears in European Russia

✦ Bears are expanding their range southward, dispersing from a large source population in the North

✦ 2000 density estimates from wildlife manag. authorities

✦ 529 districts

4. Bears in European Russia

✦ What affects bear distributions?

✦ Forest cover

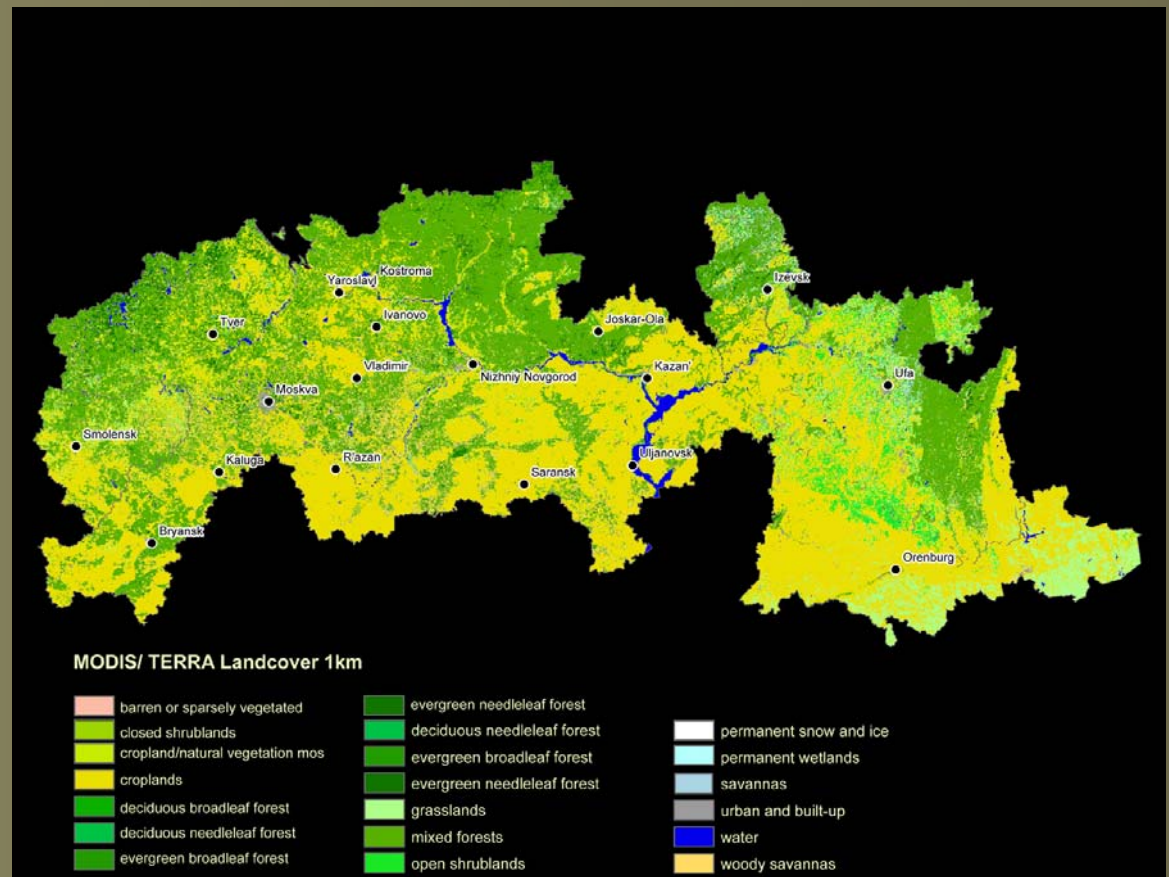

✦ Forest fragmentation

✦ Roads

✦ Settlements

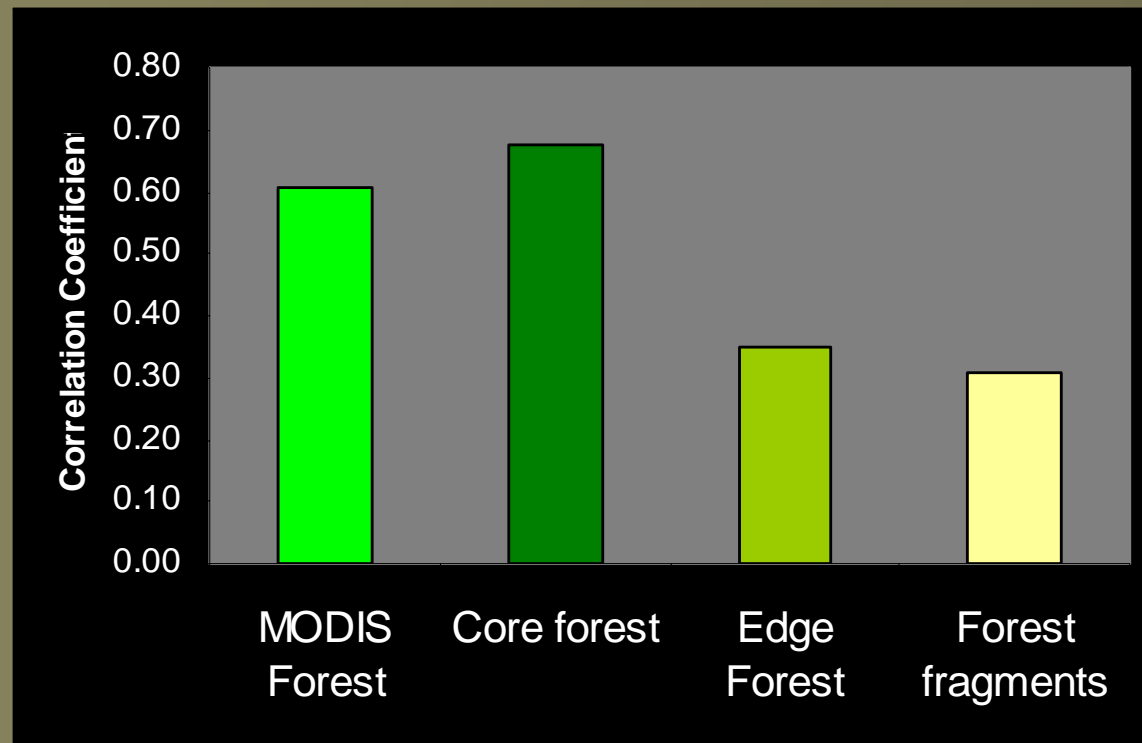

✦ Rural population

✦ Travel cost

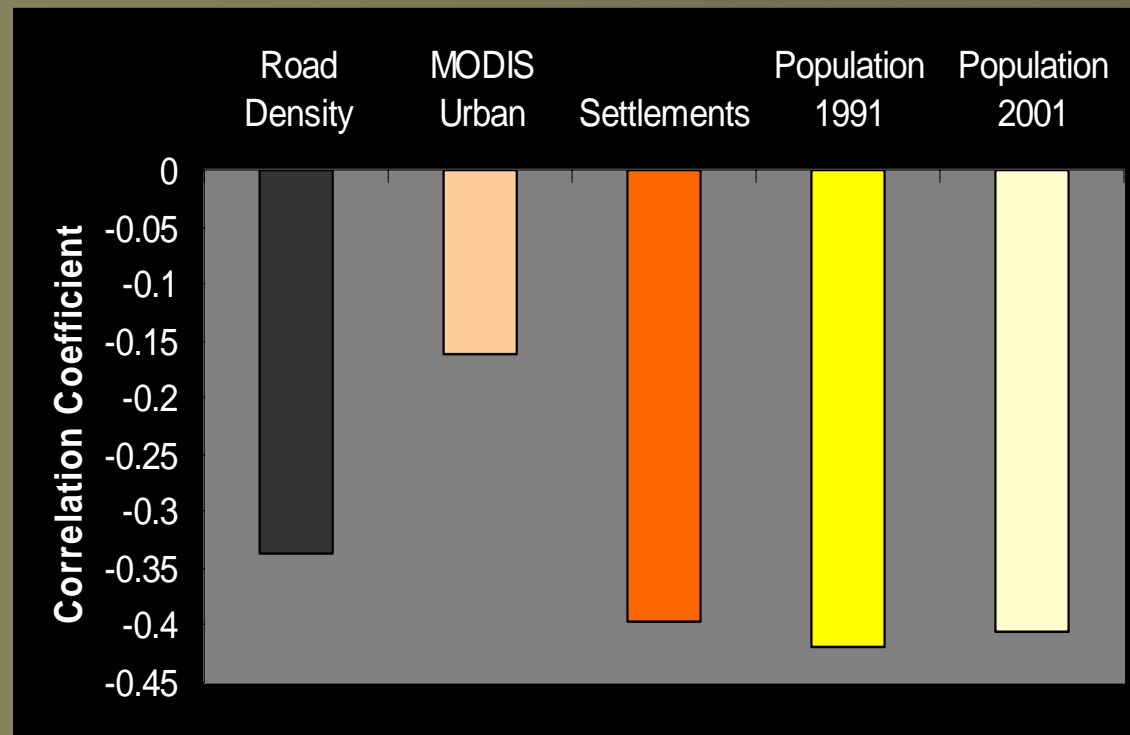

4. Bears in European Russia

- ✦ Bear density is correlated with forest cover, especially interior forest

4. Bears in European Russia

- ✦ Human presence is negatively correlated with bear density

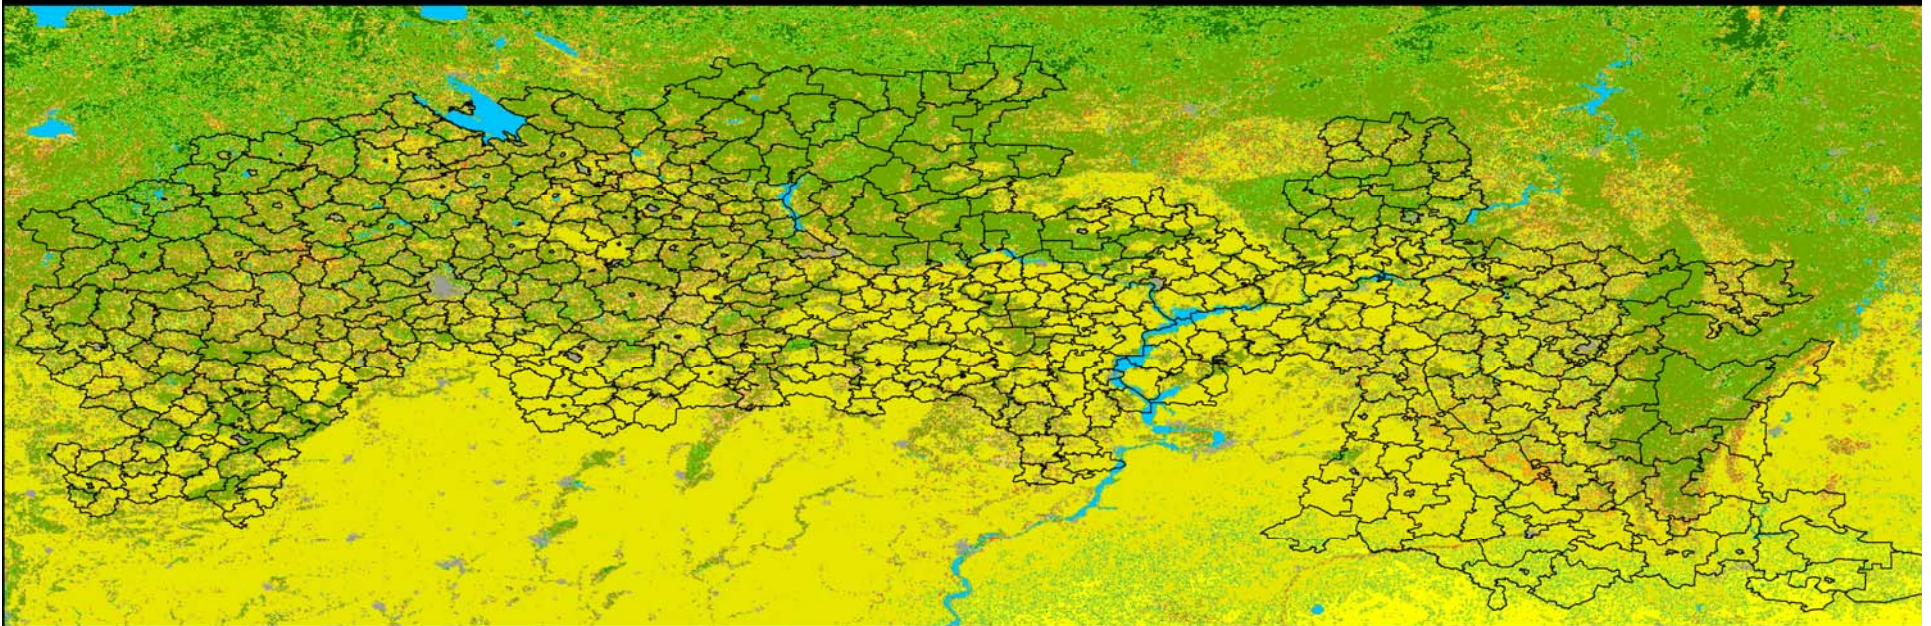

4. Bears in European Russia

Modis 12 Land Cover

Legend

	Water Bodies		Woody Savannas
	Evergreen Needleleaf Forest		Grasslands
	Deciduous Broadleaf Forest		Croplands
	Mixed Forest		Urban and Built-Up
	Closed Shrublands		Cropland/Natural Vegetation Mosaic

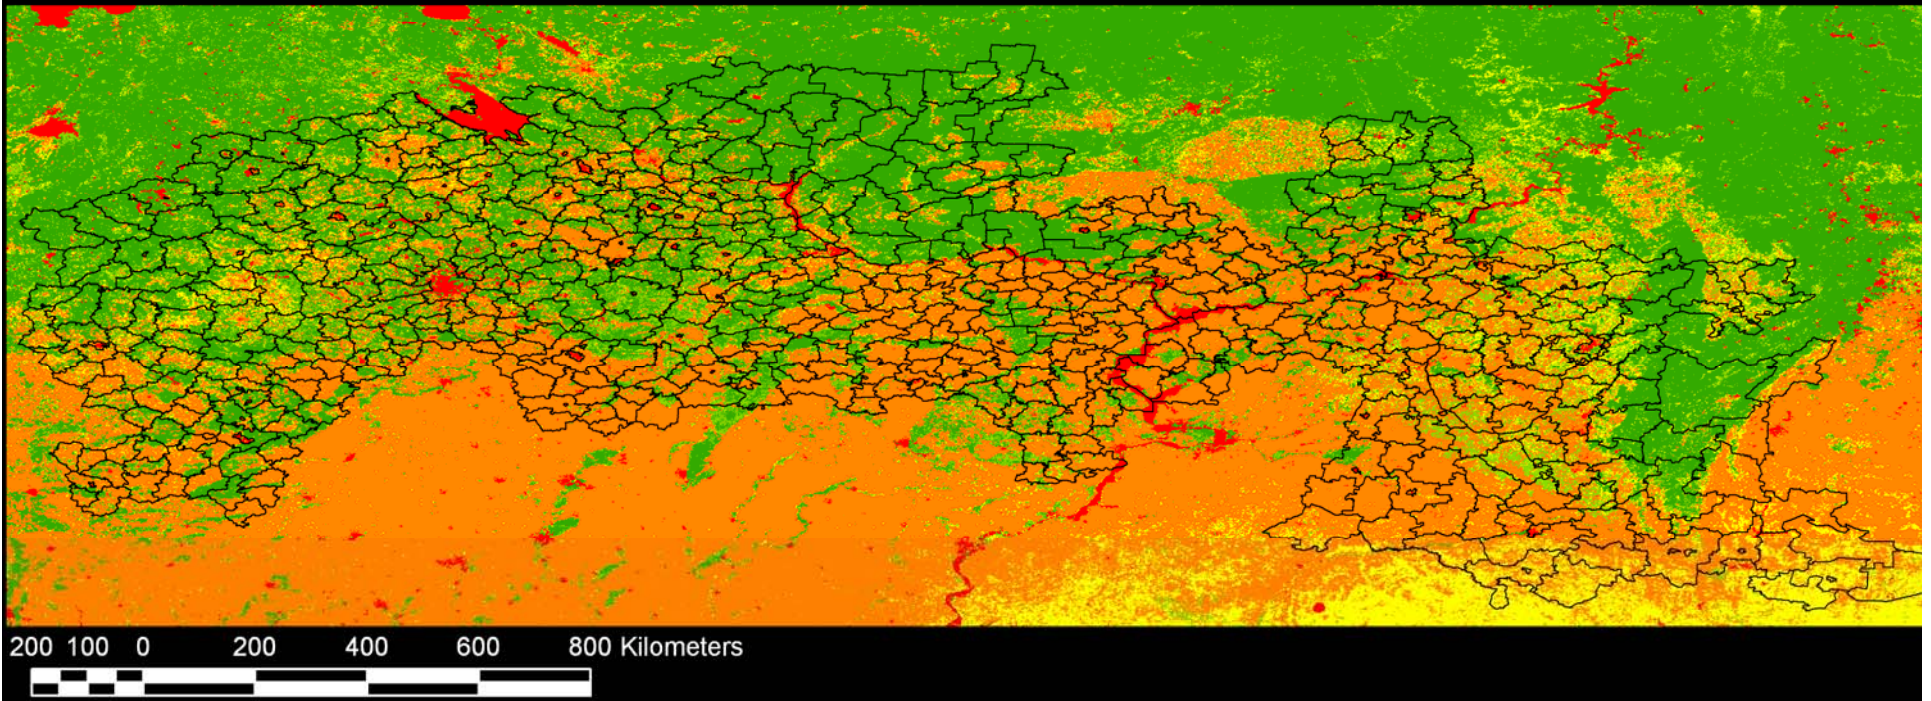

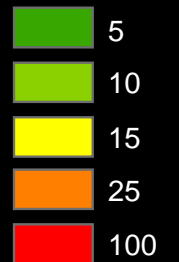

200 100 0 200 400 600 800 Kilometers

4. Bears in European Russia

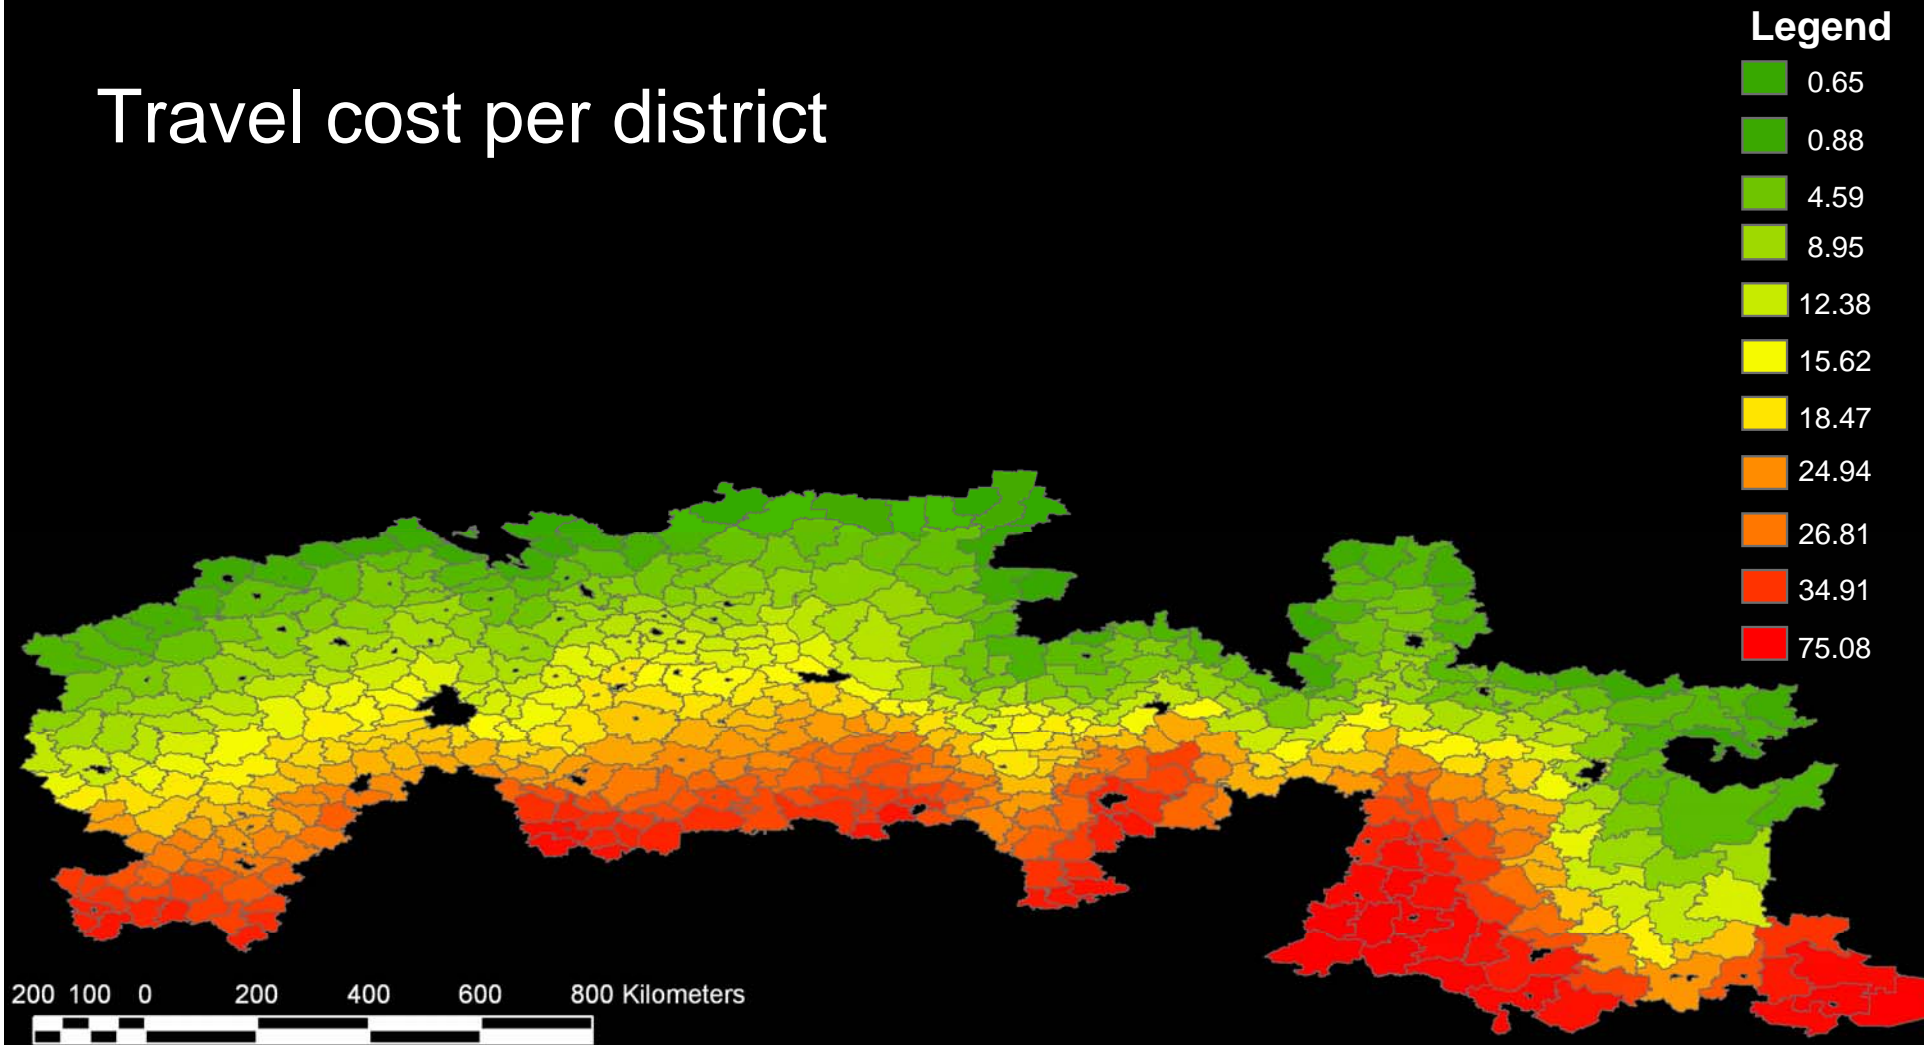

Modis based travel cost

Legend

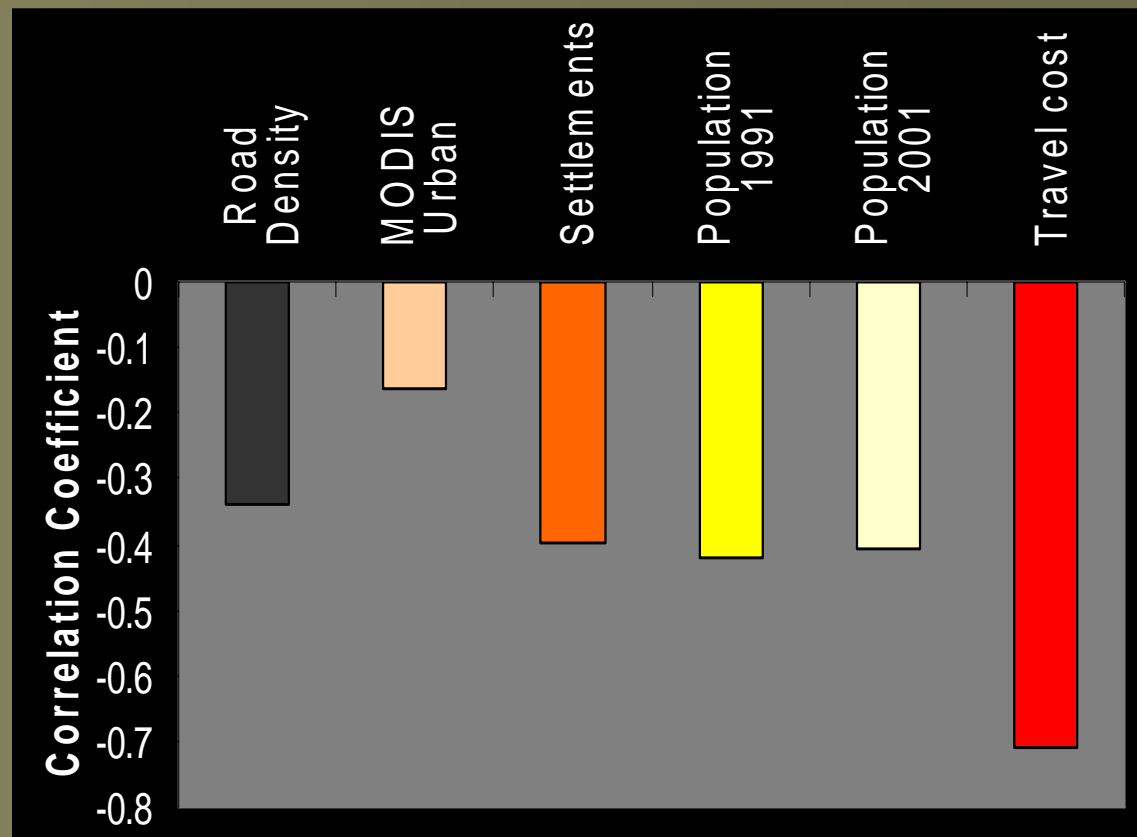

4. Bears in European Russia

Travel cost per district

4. Bears in European Russia

- ✦ Travel cost related to human disturbance is the most important negative factor for bear distributions
- ✦ Multiple regression explains 61% of the variability

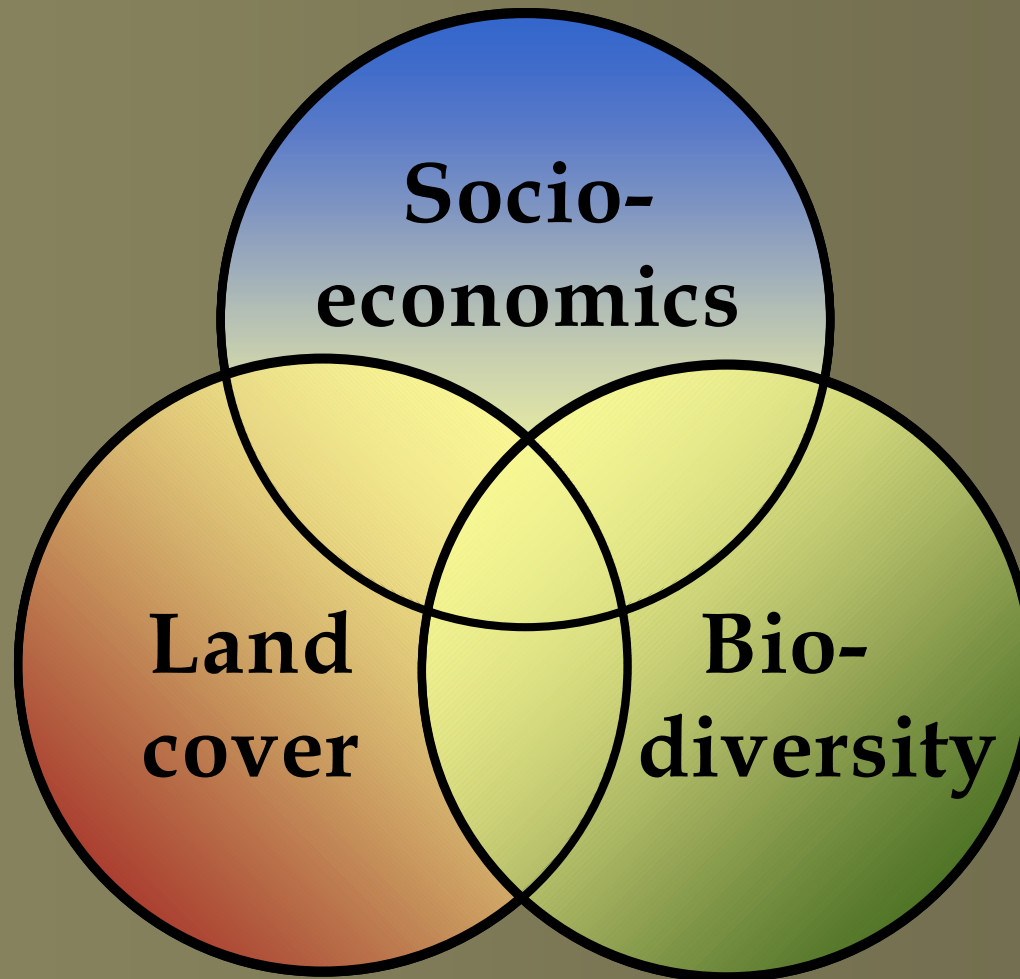

Conclusions

Conclusions

- ✦ Eastern European land cover is changing fast
 - ✦ Agricultural abandonment
 - ✦ Timber poaching
 - ✦ Lower livestock numbers
- ✦ Land use intensity is overall decreasing
 - ✦ This provides great opportunities for conservation
 - ✦ However, eroding legal structures and weakened law enforcement pose major threats
- ✦ Patterns differ substantially among countries
 - ✦ Socioeconomics, institutions, and policies matter

Conclusions

Conclusions

- ✦ Identify conservation risks and opportunities
 - ✦ Countries that are undergoing rapid landscape change require study
- ✦ Remote sensing can play an important role in explaining patterns of biodiversity
 - ✦ Assessments of land cover and land use change are powerful predictors of wildlife population patterns and trends
